AUTOMOTIVE INDUSTRIES
The AUTOMOBILE

VOL. XLVIII NEW YORK—THURSDAY, FEBRUARY 22, 1923 No. 8

Study of 1922 Statistical Story Shows Few Trend Shifts

Notwithstanding enormous production, percentages in price classes follow closely normal curve. Closed car output gains only two per cent. Truck sales take forward stride in comparison with passenger cars. Facts told by figures.

ANALYSIS of the statistical story told by the record-breaking motor vehicle production figures for 1922 discloses that there have been no sensational overturns in the trends which have been apparent since the war. This applies not only to units sold in the various price classes but also to closed cars. The percentage of closed models turned out was only 2 per cent greater than in 1921. Probably the most striking change was in relation to trucks, which took another step forward in the percentage tables in comparison with passenger cars.

Careful study of 1922 production statistics provides added evidence that it is possible to forecast fairly accurately at the close of one year what is likely to happen in the next twelve months, if due consideration is given current conditions.

A total of 2,577,000 motor vehicles was produced in 1922, of which 2,334,000 were passenger cars and 243,000 were trucks. Closed car output was approximately 633,000. The following brief tabulation gives the 1922 production of the major automotive products:

Passenger cars	2,334,000
Trucks	243,000
Motorcycles	30,000
Tractors	150,000
Tires	37,500,000

Passenger car and truck figures are entirely accurate. The motorcycle and tractor figures are reliable estimates, sufficiently exact for business purposes. The tire figure is accurate within 10 per cent.

These general statistics depict the enormous size to which the automotive industry has grown and the rapid progress made in the last twelve months. For more practical purposes, however, they must be split up into more detailed divisions and applied more specifically to current automotive selling and production problems.

EIGHTEEN months of delayed buying, reductions in prices and general improvement in business conditions all played their part in speeding up automotive production last year to a higher plane than it ever had attained before. The story of 1922 is familiar. The next problem is to relate the 1922 figures to those of previous years and thus try to determine their meaning in a relative sense.

The production data presented here are designed to assist executives in making market analyses, setting production schedules, gauging competitive conditions, and laying plans for future commercial activities. Predictions have been made in some cases. These are based on normal trends and must be correlated with a study of current conditions to be of maximum value.

Good business for the first six months of 1923 seems to be assured. Profitable business may be expected for the whole year. Some of the factors which operated to make 1922 the biggest year in history are lacking in

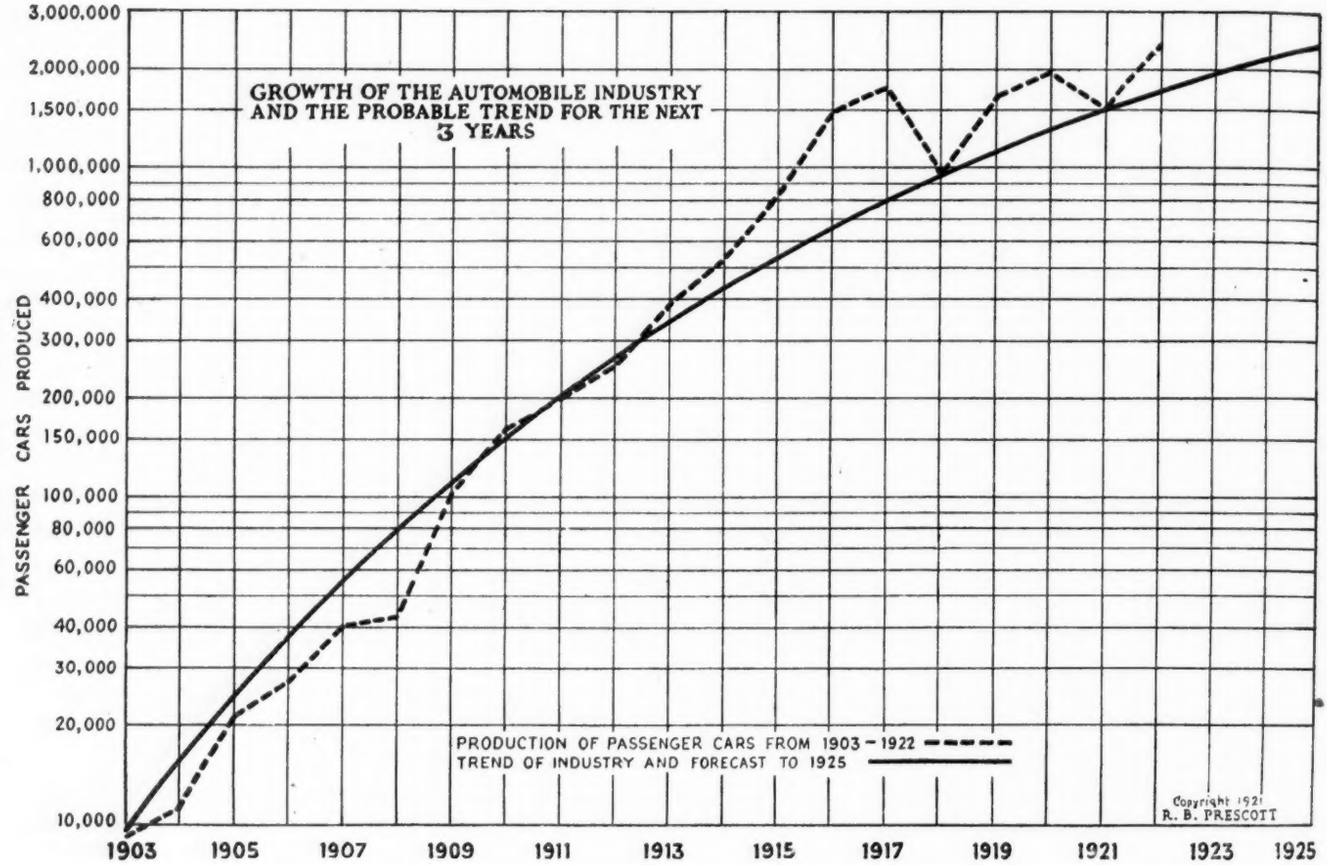

Fig. 1

1923, however. A strong demand for new cars still exists, but with it there is a corresponding demand for dealers to accept used cars in trade. The used car market must be considered as a unit with the new car market. Other conditions—some favorable, some unfavorable—have changed.

The normal curve of passenger car production indicates that about 2,000,000 passenger cars will be built in 1923. There may be some variation from this normal. The figure given for this year may be too conservative, but plans made with it as a basis are likely to be safe.

The normal trend of passenger car production is compared with actual production in the chart shown in Fig. 1. The chart in Fig. 2 gives a detailed analysis of this trend by price-classes. The prediction for 1923 indicates a slight drop from the 1922 figure in every class except the $2,000-$3,000 group. A rise there is probable, not because of any condition inherent in that class, but because a firmly established car with relatively high production has recently come into that price group from the one above.

Further analysis of production is contained in Table 1. Here is shown the actual production by price-classes from 1912 to 1922 inclusive, together with the percentage of total production in each group. These percentages do not change radically from year to year. A proper interpretation of the data makes it possible to predict with reasonable accuracy a year in advance the percentage of total production likely in each of the price groups. The following comparison of the prediction made by AUTOMOTIVE

Analysis of Passenger Car Production

Year	Under $1,000	$1,000 $1,999	$2,000 $2,999	$3,000 $3,999	$4,000 and Over
1912	128,704	87,274	13,360	5,352	9,055
	52.8%	35.7%	5.5%	2.2%	3.8%

	73.5%	20.0%	4.2%	1.3%	1.0%
1922	1,807,861	439,594	53,322	24,490	12,275
	77.5%	18.7%	2.3%	1.0%	.5%
1923	1,560,000	350,000	62,000	20,000	8,000
	78.0%	17.5%	3.1%	1.0%	.4%

Table 1

Closed Car Production by Years and Price Classes 1915-1922

(Percentage of Total Production)

	1915	1916	1917	1918	1919	1920	1921	1922
Under 1000	.014	.014	.03	.06	.09	.16	.21	.26
1000-2000	.03	.04	.05	.06	.08	.12	.18	.29
2000-3000	.07	.10	.24	.22	.24	.22	.36	.39
3000-4000	.08	.10	.10	.20	.27	.43	.41	.44
Over 4000	.27	.37	.33	.25	.27	.30	.47	.56
Total	.015	.015	.04	.07	.10	.18	.25	.27

Table 2

INDUSTRIES a year ago with the actual percentage in each price class illustrates this point admirably:

Percentage of Production in Various Price Classes

	Under $1,000	$1,000–$2,000	$2,000–$3,000	$3,000–$4,000	Over $4,000
Forecast (made 1 year ago)	78%	18%	2.5%	1%	.5%
Actual	77.5%	18.7%	2.3%	1%	.5%

The predictions for 1923 are shown in Table 1. Little change is expected in the percentage distributed to each price class.

Relative growth of passenger car and truck production since 1912 is shown in Fig. 3. In the early years, the rate of growth of car production was the more rapid. When the war came, however, truck production was materially stimulated, while car production fell below its normal rate of development.

Last year truck building went ahead relatively faster than car production. This condition is to be expected from now on. The distinction between actual growth and rate of growth is necessary, of course, to an understanding of this chart.

Quarterly fluctuation of car production is graphically shown in Fig. 4. A general survey of this chart indicates that production is affected by general business conditions just as much as by seasonal factors, if not more so. The one characteristic that has been consistent since 1914 is a decline in the last quarter, but even this fails to hold true for 1912 and 1913.

This chart has not been presented before and is worth

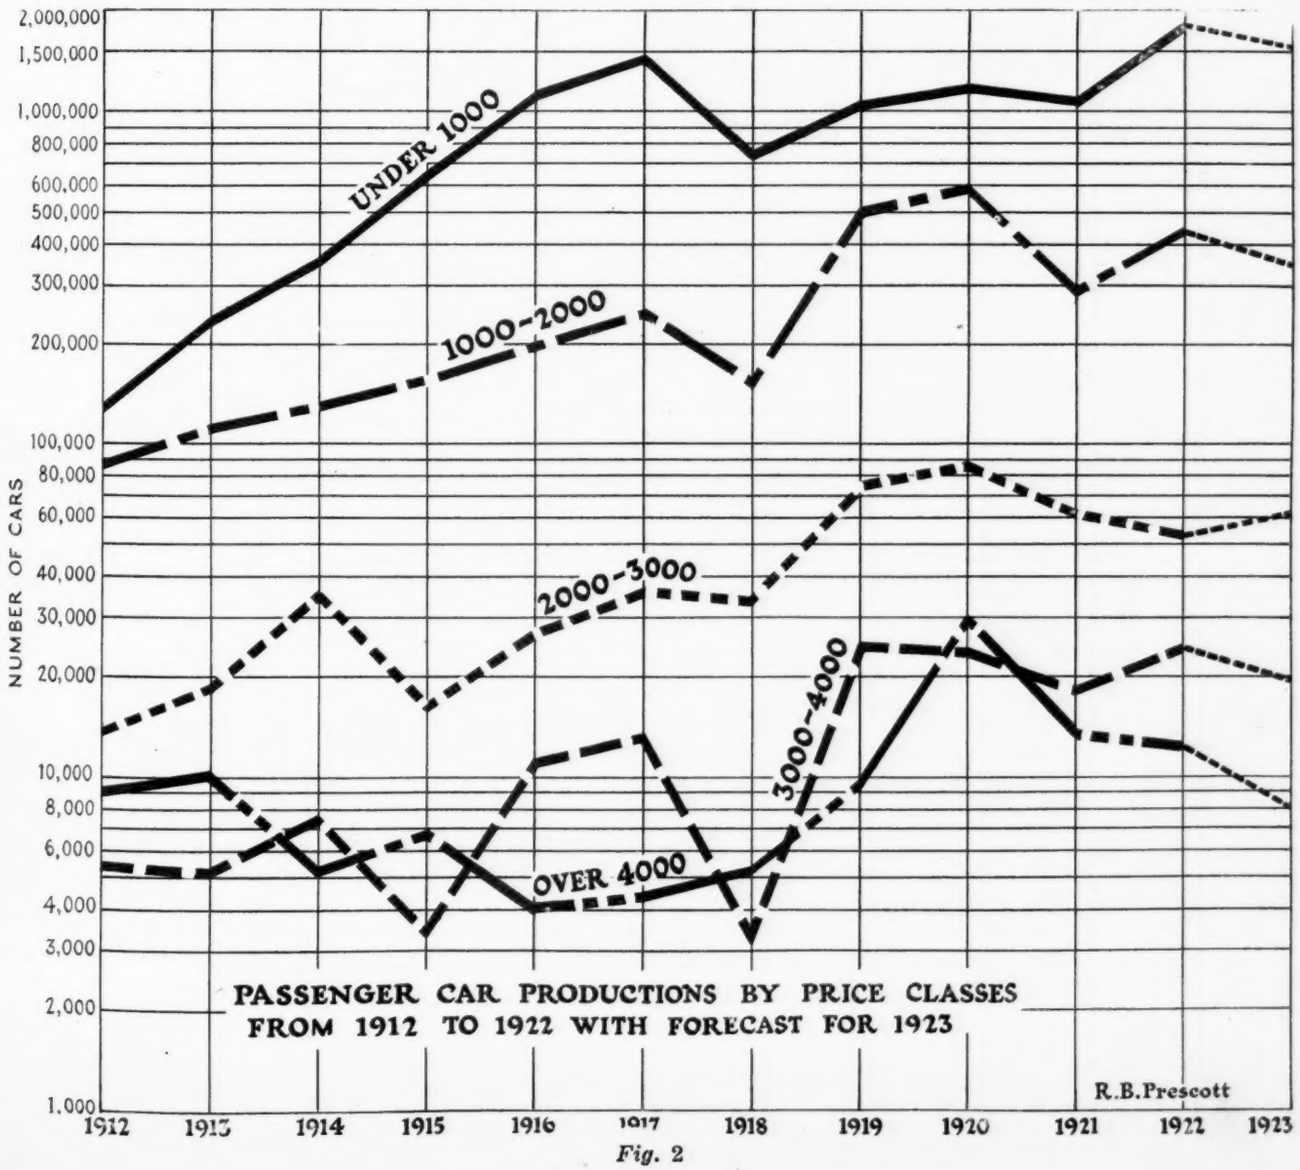

Fig. 2

Table 3

careful study in connection with sales and production planning.

Trends in closed car production are shown in Fig. 5, while Table 2 gives the statistics from which the chart was compiled. Closed car production constituted 27 per cent of the total in 1922. This is an increase of only 2 per cent over 1921. The gain would undoubtedly have been much larger had manufacturers been able to produce all the closed cars which their dealers desired. A considerable increase in the closed car percentage may be expected in 1923, provided body building facilities can meet the demand.

More than half of the high priced cars being built are already of the closed type, while even in the lowest price class, one-fourth of the total production is of closed jobs.

Production of cars by states is given in Table 3. Michigan, with Ford, Chevrolet, Dodge, Buick and other big production companies, heads the list. It is followed by Ohio, with Indiana a very close third. New York, although not generally considered a large producer of cars, stands fourth in the list.

Data on truck production is shown in Figs. 6 and 7. Since there never yet has been a series of what might be called normal years in truck production, trend studies are very difficult in this field.

Foreign Production

ESTIMATES of foreign automobile production are published this year for the first time. Official figures cannot be obtained and even reliable approximations are difficult to get.

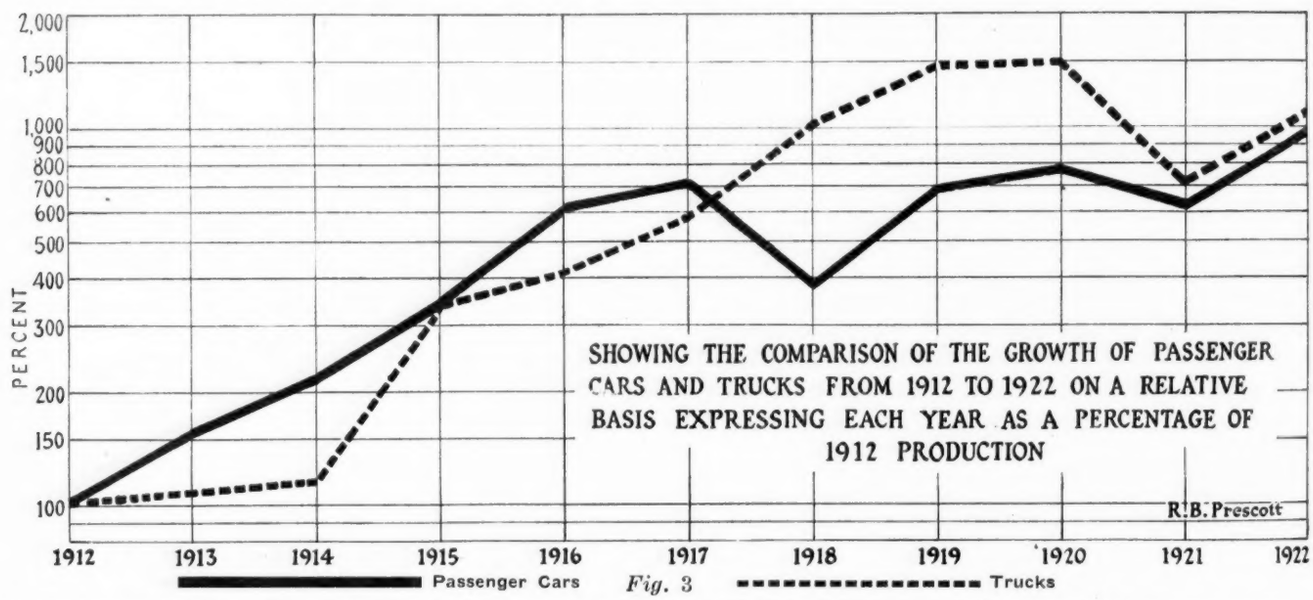

Fig. 3

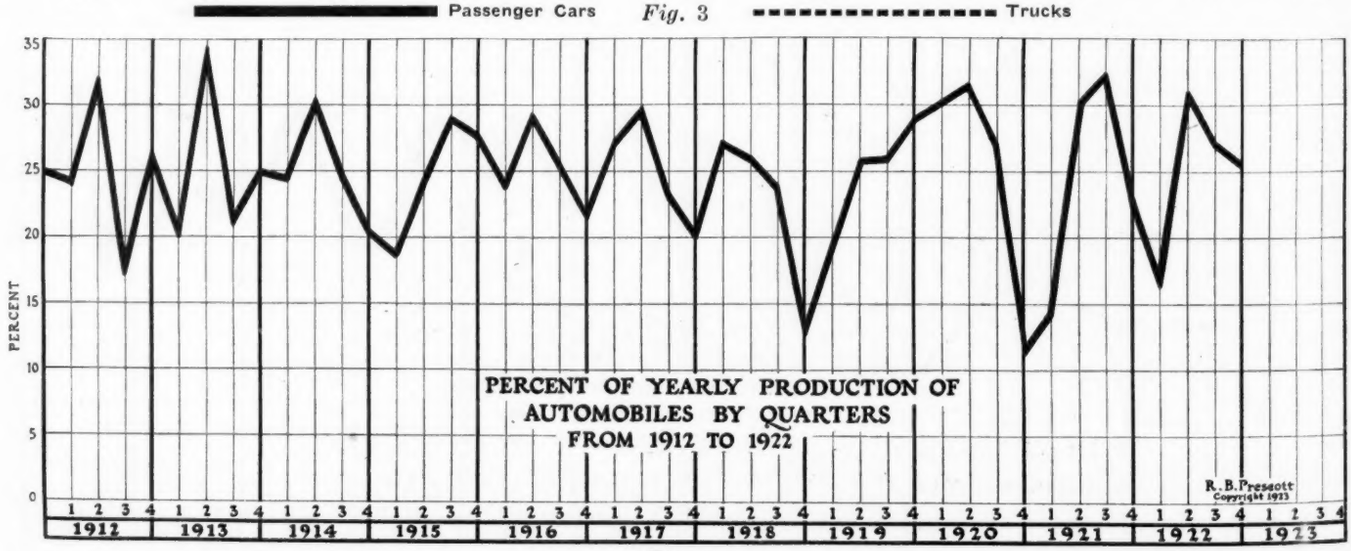

Fig. 4

Following are motor vehicle 1922 production estimates for all of the important automotive manufacturing countries in the world:

Canada	125,000
France	75,000
Great Britain	63,000
Germany	46,300
Italy	15,000
Belgium	2,600
Czechoslovakia	3,000

The Canadian estimate is based on actual production figures for 1920 and 1921 recently published by the Canadian government.

There is probably considerable duplication between the United States and Canadian production figures. Most of the Canadian production is the output of Canadian plants operated by American manufacturers. These latter usually include in their production figures the output of their Canadian plants.

French figures were compiled by W. F. Bradley, French correspondent of AUTOMOTIVE INDUSTRIES. They are based on observation, checked up with the export and registration statistics. Commenting on French production, Bradley writes:

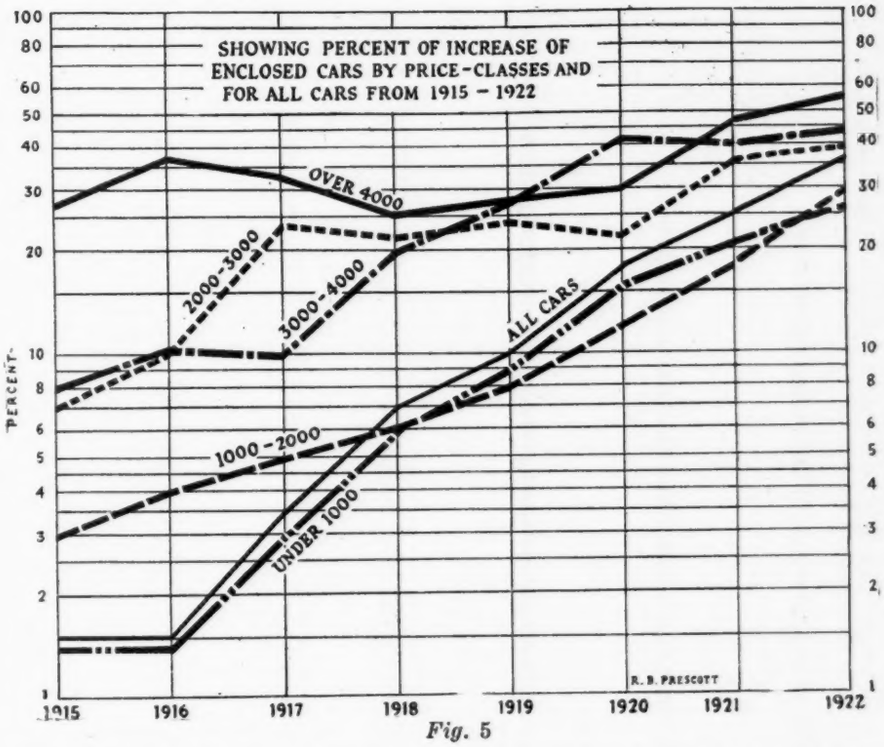

Fig. 5

"French automobile production for the year 1922 may be estimated at 75,000 cars, of which between 12,000 and 13,000 were exported. French automobile factories make no returns to any central body regarding the number of cars produced, and indeed, in the majority of cases seek to prevent any information leaking out regarding output.

"One hundred factories are engaged in automobile production, so that the average output of the French factories is 750 cars a year, or, on the basis of 300 working days a year, 2.5 cars per day. Production, however, is far from being equally distributed among the factories.

"Citroen produces the biggest number of cars, followed by Renault, Berliet and Peugeot, these four being collectively responsible for from 50,000 to 55,000 cars. The six following firms, Talbot-Darracq, Unic, De Dion Bouton, Delage, Salmson and Mathis produce between them 16,000 cars a year, thus leaving about 9000 cars to be divided among 90 firms.

"The importance of the firms cannot be judged entirely by the numerical output of cars. Thus, although Renault comes second on the list with regard to number of cars produced, the factory is the biggest in France, for in addition to cars it is engaged on aviation engines, lighting sets, factory transmissions, rail cars, and other kinds of machinery. Panhard-Levassor, while being primarily engaged in building automobiles, has a big woodworking machinery department; Peugeot is interested in bicycles and general hardware. Berliet has a part of his factory engaged on railroad material; Hotchkiss has a much bigger turnover on guns than on automobiles; and Salm-

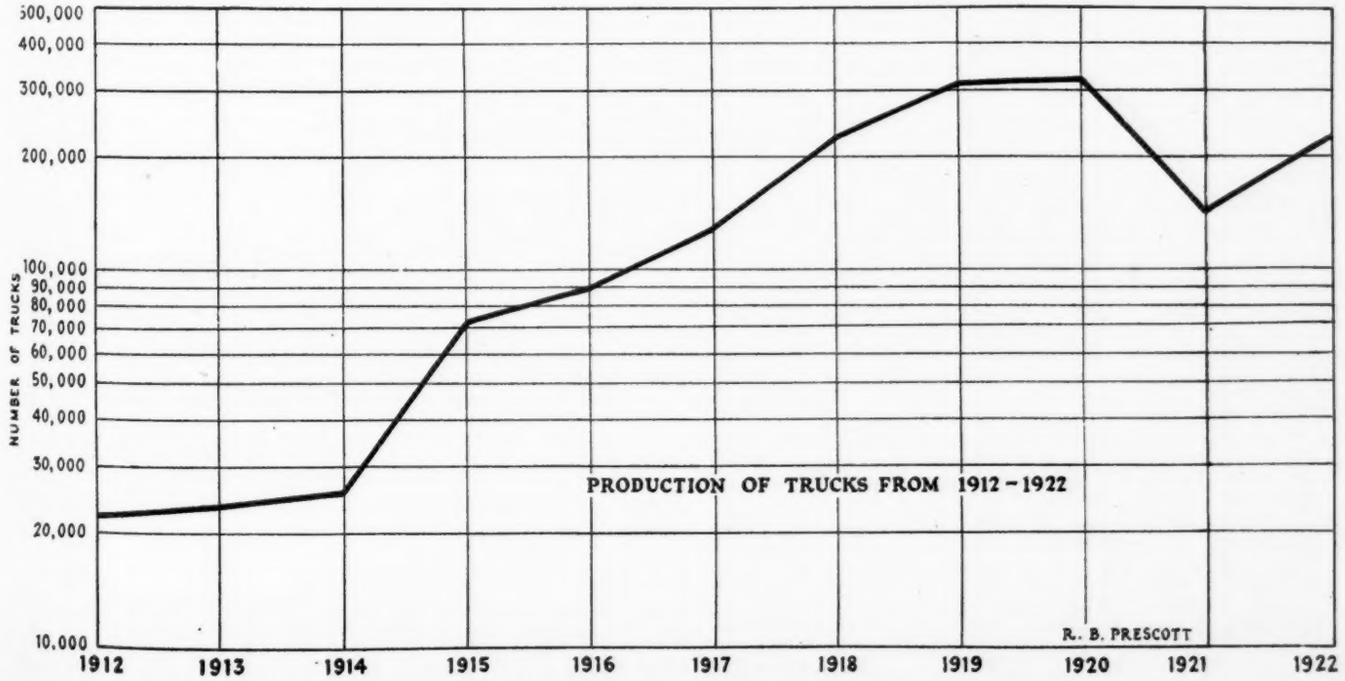

Fig. 6

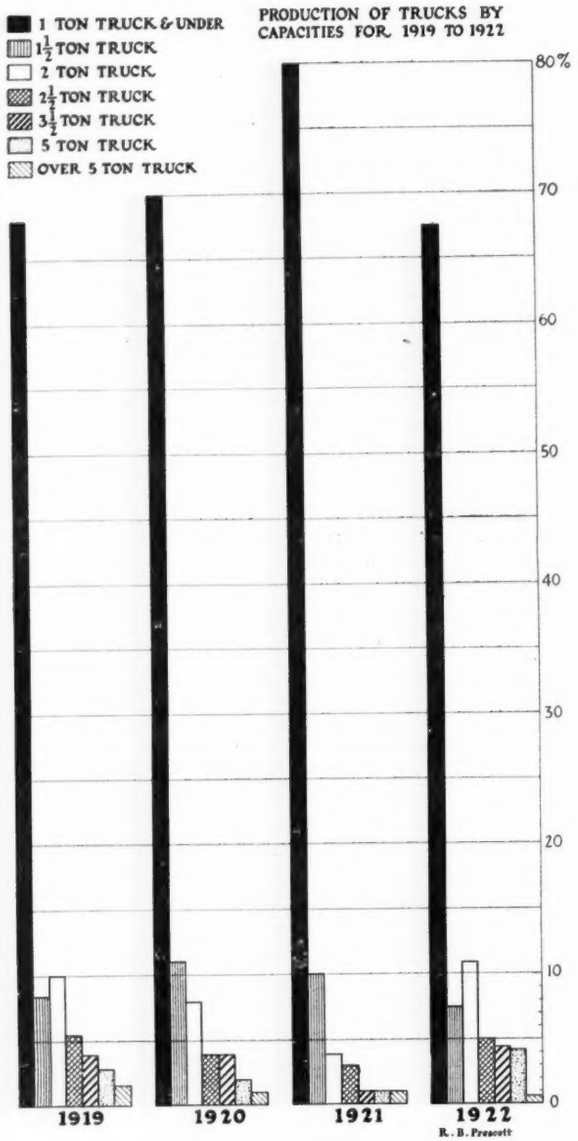

Fig. 7

son is interested in woodworking machinery, magnetos, aviation engines, and automobile bodies."

The German production total of 46,300 cars and trucks is said to be divided as follows:

Passenger cars	**31,000**
Trucks	**15,300**

Germany produced in addition about 19,000 motorcycles and about 200 tractors.

Belgian figures were developed in somewhat the same manner as the French production data, manufacturers in that country being equally unwilling to divulge production statistics.

The Czechoslovakian figures were estimated by Dr. G. Z. Stangler, Commercial Attaché, Czechoslovakian Legation, Washington, D. C.

The Italian figures are estimates based upon a report that the capacity of Italian manufacturing plants is about 35,000 vehicles a year, while 1922 operations were near 43 per cent of capacity.

A general examination of these foreign figures indicates the estimates to be liberal rather than conservative. They are sufficiently accurate, however, to give some idea of what work is being done in the foreign automotive manufacturing countries. The difference between European production methods and ideas and those of the United States is well known. It is aptly illustrated, however, by the fact that five individual American companies last year each built more passenger cars than were turned out by the 100 manufacturers in France.

Foreign automotive manufacturing countries depend on the export market to a far greater extent than do domestic producers.

France exported about 17 per cent of its total production according to the above report, while advices on Czechoslovakia indicate that an export market of nearly 50 per cent is necessary to maximum plant operations.

Recent reports from Great Britain indicate that a market of 125,000 vehicles is expected in that country for 1923. British manufacturers expect to build about 75,000 cars and trucks, the remaining 50,000 being conceded to imports from other countries. At the present time more than 300 makes of passenger cars are being offered in England. Of these 138 are British, 97 American, 54 French and 24 of other nationalities.

French Aviation Development

FRENCH aerial navigation lines, with completely equipped stations, workshops, wireless stations and emergency landing grounds, will total 6420 miles during the year 1923. These comprise only lines approved by the Government department and over which regular freight and passenger carrying planes are flown. The list is as follows:

Paris to London	233 miles
Paris to Marseilles	454 miles
Paris to Geneva	279 miles
Paris to Brussels	170 miles
Paris to Havre	112 miles
Paris to Cologne, Germany	249 miles
Paris to Constantinople, Prague and Warsaw	2,096 miles
Toulouse to Casablanca	1,146 miles
Casablanca to Oran	424 miles
Antibes to Tunis, N. Africa	590 miles
Alger to Biskra, N. Africa	220 miles
Dakar to Kayes, N. Africa	447 miles
	6,420 miles

At the end of 1922 France possessed 30 civilian airplane landing grounds under Government control. This is exclusive of private grounds and military air ports. The detail is as follows:

Aerial ports completely equipped or under construction	30
New landing grounds not completely equipped	3
Landing grounds being purchased	19
Proposed landing grounds	13
Flying boat stations equipped or under construction	4
Proposed flying boat stations	12

Seven French aerial navigation companies had 240 planes in commission on passenger and freight-carrying service according to returns dated August 31, 1922. The companies are:

Messageries Aerienne	49
Grands Express Aériens	9
Franco-Roumaine Co.	79
Compagnie d'Entreprises Aeronautiques	64
Aero-Naval Co.	3
Transports Aériens Guyanais	10
Compagnie Aérienne Française	26

14,743,468 Motor Vehicles Registered Throughout the World

Cars and trucks outside United States total 2,379,091. Increase of 17.12 per cent over world total of year ago. This country has 83.8 per cent of total registration. Total for Spanish-speaking countries reaches 289,153. Foreign sales prospects bright in 1923.

APPROXIMATELY 14,743,468 motor cars and trucks are in operation in the world, according to the 1922 census just completed by AUTOMOTIVE INDUSTRIES. The United States has 12,364,377, or 83.8 per cent. The number outside the United States is 2,379,091. These figures represent an increase of 17.12 per cent over the 1921 world registration survey.

Automotive progress outside the United States was steady in 1922. Comparison of this 1922 survey with that of one year ago reveals certain outstanding features. Among the most important are the following:

Registrations outside U. S., Jan., 1923	**2,379,091**
Registrations outside U. S., Jan., 1922	**2,083,289**
Registration gain outside U. S.	**295,802**
Percentage registration gain outside U. S.	**14.12%**
Percentage registration gain in U. S.	**17.90%**
Percentage registration gain for world	**17.12%**

The figures are the latest available from the various countries. It is manifestly impossible to obtain figures for the entire world as of any given date. Nearly all the statistics in the accompanying tables, however, apply to July 1. 1922, or to some later date. Many of them are for Jan. 1, 1923.

Estimates have been necessary, of course, in many cases. These have been made very carefully on the best authority available. Their accuracy may be questioned in certain instances. AUTOMOTIVE INDUSTRIES will be glad to receive further information tending to supplement the data published.

It should be noted that the increase recorded contains many variables, since some 1921 estimates have been revised upwards in light of later information, while others have been decreased materially. The Hawaiian figures, for example, show some 15,000, as against 1500 in last year's table, the 1921 figure having been a misprint. The estimate for Russia, on the other hand, has been decreased from 35,000 to 15,000 in view of reports recently received. Such changes as these make it impossible to regard the increase noted in the same specific sense as data for the United States alone is viewed.

Registration by Continents

The registration by continents shows North and South America well in the lead by virtue of including the United States, with Europe second. The totals are:

North and South America	13,078,279 (713,902 exclusive of U. S.)		
Europe	1,302,153	Asia	144,479
Oceania	147,189	Africa	71,368

The 2,379,091 cars and trucks outside of the United States are distributed on a percentage basis approximately as follows:

North and South America	30.0%
Europe	54.8%
Oceania	6.2%
Asia	6.1%
Africa	3.0%

Basing the percentages on the total world registration figure, including the United States, the distribution is:

North and South America	88.9%
Europe	8.9%
Oceania	.9%
Asia	.8%
Africa	.5%

Sales in Europe

About 190,000 new motor vehicles were sold in Europe last year, despite unstable economic conditions in many areas. Higher registrations are shown in nearly every country. The world has needed additional transportation and has found means to get it. Currency fluctuations, political upheavals and economic stress have all hindered automotive sales, but material progress has been made nevertheless. In a recent statement about the world economic situation for 1923, Herbert Hoover pertinently says: "Outside of Europe the world has shaken itself free from the great after-the-war slump. The production and commerce of Asia, Africa and Latin-America have recovered to levels above the pre-war. The enforced isolation of many areas of Latin-America and Asia during the war has strengthened their economic fibre by increased variety of production and has contributed vitally to their economic recovery.

"The odds are favorable for 1923; the world begins the year with greater economic strength than a year ago; production and trade are on a larger and more substantial basis, with the single exception of the sore spot in Central Europe."

Leading automotive exporters bear out this favorable forecast. Latin-America, Australia, Scandinavia and India are looked upon as specially favorable markets for the next twelve months.

The Spanish and Portuguese speaking countries, most of which are in South America, have a total of 289,153 cars and trucks, nearly as many as Asia and Oceania combined.

American exporters played a large part in the selling activities, which increased the number of motor vehicles outside the United States by some 295,000. American

cars and trucks to the number of about 185,000 went into operation throughout the world during 1922. Thus it appears, American manufacturers supplied some 63 per cent of the new motor vehicles sold in foreign fields in the last twelve months. The American figure used includes American and Canadian exports and the production of Ford foreign assembly plants, since this is the only figure which gives a true picture of American automotive export business.

Gains in United Kingdom

Great Britain has the largest car and truck registration in the world, outside of the United States. Latest figures from the United Kingdom show a total of 554,443, as against 487,099 for Canada, which is second, and 290,303 for France, which is third. The French figures, however, are available only as of Jan. 1, 1922. The number of vehicles actually in operation there at the present time is probably 15 per cent greater than the figure given.

The recent world census published by the Automotive Division of the Bureau of Foreign and Domestic Commerce showed a total of 14,622,161. This was 121,307 lower than the total given here as a result of the AUTOMOTIVE INDUSTRIES survey. The difference is accounted for chiefly by the following statement made by the Automotive Division concerning their figures: "The figures were furnished during 1922 and generally cover the previous year . . ."

The figures given in the present article, as previously noted, are almost all as of July 1, 1922, or later, 1921 figures having been used in a relatively few cases.

Approximately 879,000 motorcycles are in use throughout the world. This figure involves estimates in many countries where some data is available, and simply guesses in other cases. Information actually gathered, however, shows 609,000 motorcycles in Europe and 219,000 in North and South America, with several important countries missing in both cases.

So little tractor data are actually available that it is impossible to make even a reasonable guess as to the total number of tractors in use in the world.

The world registration survey has been more widely extended this year. Automotive figures are given for 115 different countries in the accompanying tables, as against reports from only 79 last year. The additions have been chiefly smaller countries, but their presence makes more complete the picture of motor vehicle distribution throughout the world.

Five countries have more than 100,000 cars and trucks in operation. Totals have grown, however, in practically every civilized part of the world. Better roads are being urged in many lands and active work is being done toward making conditions more favorable to effective use of motor transport.

The detailed study by continents of world automotive registrations, beginning on the next page, will be of interest to automotive executives from both a sales and production viewpoint.

North and South America

EXCLUDING the United States, 713,902 cars and trucks are in operation in North and South America. This is an increase of 57,452 over a year ago. Canada has 23,651 new motor vehicles, leaving a gain of 33,801 for the other countries in this group.

Canada has made considerable automotive progress in recent years. A more extensive system of good roads is being urged for the Prairie Provinces and large grain crops recently have been instrumental in providing increased buying power.

Canadian registration data are available in considerable detail, showing the distribution of cars and trucks throughout the Dominion. The present status is as follows:

	Cars	Trucks	Motorcycles
Alberta	29,692	7,953	2,318
British Columbia	22,950	8,923	1,954
Manitoba	27,414	9,987	3,475
New Brunswick	11,027	1,654	567
Nova Scotia	11,185	2,340	997
Ontario	199,487	28,654	5,859
Prince Edward Island	1,397	239	64
Quebec	52,622	11,000	2,856
Saskatchewan	51,451	9,124	3,480

Alaska figures are given this year for the first time. They are an estimate based upon accurate data for the Chugach and Tangass National Forest areas furnished by Chas. H. Flory, District Forester. This region embraces all of the principal towns in Alaska and the bulk of the population. Its road mileage, however, is not large.

The figure used for Newfoundland this year is smaller than last year's, because official detailed data has been obtained recently for the first time.

Very recent information is presented from most of the South American countries. Estimates have been made in several cases to bring the figures up to date. In a few cases authorities differ considerably as to the number of automobiles in these countries. In Cuba, for example, estimates from reliable sources vary from a minimum of 15,000 to a maximum of 30,000. The figures given, 20,000 cars and 5,000 trucks, are probably near to being accurate, judging from all available information. Recent information indicates that the figure given for Cuba last year was too low. Consequently, the actual gain for that country is less than might be assumed from a comparison of the figures for the two years.

Figures for Philippine Islands are quite accurate, since very detailed statistical records are kept in that country.

Only estimates are available for Mexico as a whole, various sources making calculations ranging from 25,000 to 32,000. A close analysis of these various estimates,

NORTH AND SOUTH AMERICA

Country	Date	Total Cars and Trucks	Cars	Trucks	Motor-cycles	Tractors
Alaska	Jan. 1923	336	219	117	.....	.....

Total	.....	13,078,279	11,451,117	1,605,162	219,585	441,114

however, indicates the figure of 29,000 given here to be very nearly correct. Detailed reports show that in the latter part of 1922 Mexico City had 11,381 passenger cars, 2,115 motor trucks and 478 motorcycles.

Of the 300 motor vehicles in Nicaragua about 125 are located at Managua, 67 at Granada, and the remainder in other districts. The figure published for Nicaragua in 1921 was too high, according to information recently obtained.

Figures given for Porto Rico are based upon data from the Department of the Interior of the Porto Rican government which showed a registration of 6,839 cars and trucks in November, 1922.

Latin American statistics have been gathered from numerous sources.

Actual registrations are not available from the Argentine, but it is probable that the number of cars and trucks in operation has already approached very closely to 100,000. The figure of 90,000 given here is a fairly conservative estimate. Argentina has become one of the major automotive countries of the world, ranking seventh in the world list of total automobile registrations.

Difficulty still exists in obtaining a satisfactory census of automotive vehicles in Bolivia. The figure of 400 given here is the estimate of D. C. McDonough, the American Consul at La Paz. Commenting upon the estimate, McDonough says that almost all of the automobiles sold in Bolivia have come from the United States. The market is now improving, he adds, owing to higher exchange and higher prices for tin, Bolivia's chief product. The automobiles most commonly used in Bolivia are American medium priced touring cars. Most of them are used in local taxi service. Bolivian conditions of operation require an abundance of power and a motor which will climb hills at a high altitude.

For some of the smaller countries in North and South America it has been necessary to make estimates based on American and Canadian export figures. Figures developed in this way include those for the following countries: British Honduras, Barbados, Jamaica, Trinidad and Tobago. Other British West Indies. Dutch West Indies, French West Indies and Haiti.

Europe

EUROPE, with a total car and truck registration of 1,302,153, includes 54.7 per cent of the automotive registration of the world exclusive of the United States. Trucks constitute a far larger proportion of the total registration in Europe than in the United States. The proportion in the United States is something like 9 to 1, while incomplete European figures indicate a proportion of about 2½ to 1.

The United Kingdom leads other European countries in use of motor vehicles. A quarterly system of registration makes it difficult to determine exactly how many automobiles are in operation in Great Britain. Figures used in the accompanying table represent the high point of British registration which was reached Aug. 31, 1922. Later figures as of November, 1922, record lower totals for passenger cars and buses, but slightly higher totals for trucks. Many vehicles are put up for the winter and are not recorded in the quarterly registrations of the fall and winter months. The Aug. 31 figure has been used in preference to that of November because the former indicates more accurately the number of motor vehicles in the hands of owners in the United Kingdom.

French registration is available in great detail for 1921, but no figures of any accuracy can be obtained for a later date. Consequently, the figures used in the accompanying table indicate the cars and trucks in use in France over a year ago. It is estimated that present motor vehicle use is probably 15 per cent greater than is indicated by these 1921 figures.

Motor vehicles in Belgium are registered only once, the license numbers being cumulative from year to year. To determine the actual number of vehicles now in operation, it has been necessary to make an estimate of the number of vehicles which have gone out of use. Commenting on the Belgian registration system, our correspondent states, "The license number is delivered only once, and has nothing to do with the payment of yearly taxes. The license is cancelled only by destruction, loss or death of the owner. If the owner disposes of the vehicle he returns the tag to the proper authorities for cancellation."

At least 80 per cent of the automobiles in use in Bulgaria are in Sofia, according to American Consul G. H. Kemper. There are in Bulgaria, Kemper states, a number of automobiles which were discarded after the war. These number several thousand, but would not be suitable for service unless entirely rebuilt and, consequently, should not be included in any estimate of the vehicles in use in Bulgaria.

Bulgarian roads are kept in reasonably good condition

by compulsory labor service. In some sections of the country the roads are excellent. The comparatively small number of motor vehicles in use is due chiefly to the high cost of fuel and the generally unsatisfactory economic condition of the country. Fiat has made more sales in Bulgaria than any other manufacturer. Its organization in Bulgaria is better than that of any of its competitors although a few American, Austrian and German cars have been sold there during the last two years.

Estimates for Czechoslovakia vary from 6000 to 9350. The latter figure having been confirmed from more than one source, however, is apparently the most accurate.

No official figures are available regarding the number of automobiles in Italy. The figure of 65,000 given here is based upon reliable information from a number of sources. It may be a little high.

Conflicting reports have been obtained concerning the Netherlands. Car registration estimates vary from 8000 to 20,000, and motorcycle estimates from 18,000 to 25,000. It seems to be generally agreed that the trucks in use number about 2750. Both the Automotive Division of the Bureau of Foreign and Domestic Commerce and the General Motors Export Corporation estimate the number of cars at 20,000, and that figure has been used here.

Poland has also developed very confusing estimates. Car registration figures varying all the way from 2500 to 12,700 have been obtained. Careful analysis indicates that the figure of 2500 is far too low. The figures used in the accompanying table seem to be authentic, having been obtained from the Polish government through the Polish Automobile Club at Warsau.

Roumanian figures constitute an estimate based upon exact figures for a part of the country. Complete registration statistics of motor vehicles in that country are not available, although the Roumanian Ministry of the Interior is at present engaged in collecting data which will probably be completed in the near future. It is estimated by American Vice-Consul D. R. Heath that 20 per cent of the cars in Roumania are of American origin.

Swiss figures are based upon a reliable estimate made by the Automobile Club at Geneva.

Official statistics are not available in Jugoslavia, but estimates made by Consul K. S. Patton on the basis of information secured from private sources placed the total number of cars and trucks at 2,200.

Oceania

THE importance of Australia as an automotive market is well illustrated by the fact that the group of countries included in Oceania, despite their small area, have a larger motor vehicle registration than the whole of Asia. With a registration of 97,189, Australia shows a gain of 23,289 or 31½ per cent over last year. Australian figures are available in great detail.

Leading American exporters consider Australia to be one of the most promising markets for 1923. A continuance of 1922 buying is expected. Despite the high Australian duty on automobile bodies, several important American firms report an increasing number of complete cars being sold to the Commonwealth.

Accurate figures for Hawaii are given in the accompanying tables. The figure shown last year was too low by nearly 90 per cent.

Annual registration is not required in New Zealand. As long as an owner keeps his license paid up for any particular car it remains under the original number. If the car is sold or destroyed the original number is abandoned. Many old cars bear license numbers which are much higher than those on cars manufactured during the current year. The estimated figures of 30,000 cars and 4500 trucks used in the accompanying tabulation were made by Consul General D. F. Wilber.

New Zealand is not able to keep up with her need for good roads, Wilber states. The estimated total length of roads is 64,320 miles. According to some estimates, it would require over 100,000 miles of highways to properly serve the present population of 1,300,000. Various attempts have been made to legislate a state road building policy, but opposition of various kinds has prevented definite action thus far.

OCEANIA

Country	Date	Total Cars and Trucks	Cars	Trucks	Motor-cycles	Tractors
Australia	Nov. 1922	97,189	87,721	9,468	39,000	841

Africa

TOTAL automotive registrations in Africa have now climbed to 71,368. This records a gain of 15,536 over the figures published last year. Part of this gain, however, is apparent rather than actual, since statistics have been obtained this year from many places where they were not available before. This year registrations are given for 28 countries in Africa while last year information was recorded from only 17.

In a few countries, relatively unimportant from an automotive standpoint, such as Nigeria and Senegal, it has been impossible to obtain recent figures. Since automotive development in these areas is undoubtedly very slow, however, the figures given are probably not far from accurate.

The Union of South Africa is the most important automotive state in Africa. It has in operation 34,000 passenger cars, 1,500 trucks, 16,000 motorcycles and 1,200 tractors.

Next in importance ranks Algeria with 13,000 cars and 1,500 trucks. A recent report from Consul E. A. Dow states that French cars are usually preferred in Algeria, chiefly because French concerns have been able to maintain parts stocks to a greater extent than manufacturers of other countries. Italian cars have also entered the Algerian market, however, with some success. The French dominate the truck as well as the passenger car carket, but the Fiat truck has made some progress. Large and expensive cars are difficult to sell in Algeria because of the very limited number of wealthy people and the high cost of gasoline.

American Trade Commissioner P. J. Stevenson has furnished us not only with figures for the Union of South Africa, but also with data for Rhodesia, German Southwest Africa, Belgian Congo, Mauritius and Portuguese East Africa. The figures in each case are estimates brought up to date and checked by representatives of American firms selling automotive products in the various countries.

Automotive development in the other African countries has been comparatively limited but some progress is shown in practically every area.

Asia

AUTOMOTIVE registration figures for Asia have been difficult to compile with accuracy. Rather complete data are available for some of the more important automotive countries such as India and Philippine Islands. India has the greatest motor vehicle registration in this group, 54,415 cars and trucks being in operation. Dutch East Indies ranks second with 23,000, Philippine Islands third with 13,000, and Japan fourth with 8801.

Motor vehicle figures for the entire Malay Peninsula have been combined because of the difficulty of separating them accurately into their component parts.

Both the Malay Peninsula and the Dutch East Indies offer good automotive prospects. Excellent highways run throughout the Dutch East Indies, and it is possible to travel nearly all over Java and Sumatra on good roads. The Malay Peninsula also has abundance of good roads.

Competition in the Dutch East Indies is reported to be keenest from the Italians, Fiat being the leading Italian make in the market. The French manufacturer, Citroen, however, is also strong.

Figures for Arabia are made up of definite data for a few important centers, and estimates for the rest of the country. The figures are probably quite accurate, however, since there are practically no roads at all in Arabia outside of Aden and a few other towns of some importance. No highway development is planned, according to Consul Raymond Davis.

There is some confusion in connection with the figures for India. Those given, however, are probably reliable for all practical purposes. American Consul General A. W. Weddell, commenting upon the method of registering motor vehicles in India, states that "the system of registration in India is highly unsatisfactory from the standpoint of accuracy, and not to be compared with the registration in the United States. In the majority of provinces in India motor cars are given consecutive numbers as registered, and these numbers are not changed annually, but are retained throughout the life of the car; no number plates are issued, the numerals merely being painted on the body of the car. When cars fall into disuse or are removed to another province, the police frequently are not informed, and in many places they have apparently no way of knowing the actual number of cars in their district. It appears that from some provinces the number

THIS complete census of automotive vehicles in use throughout the world has been made possible by the hearty and capable cooperation of many persons and organizations in every country. In discussing the accompanying article it has been possible to mention specifically only a very few of these. The assistance rendered by the others has been equally valuable.

American consuls have made strenuous efforts to procure detailed and authoritative information, and in many cases have sent us comprehensive marketing data in addition to the statistics requested. We hope to print more of this information in later issues. The Automotive Division of the Bureau of Foreign and Domestic Commerce has rendered valuable assistance at various times. Private automotive firms, chambers of commerce and automobile clubs have contributed freely both effort and information. Special foreign correspondents of Automotive Industries have obtained much data never before available. To each of the sources the automotive industry owes a debt of gratitude.

We take this opportunity to express our deepest and most sincere thanks to all those who have so ably contributed to this compilation in the interests of automotive transportation progress.

of vehicles reported to the Director of Statistics includes all that have been registered since automobile registration was first introduced, whereas the number reported for other provinces includes only the number actually in use as computed from the payments of annual taxes or fees upon motor cars."

Use of automotive vehicles in Siam is confined largely to Bangkok, although it would undoubtedly be much larger in Upper Siam and Siamese Malaya if good roads were available in the latter areas, according to American Consul M. P. Dunlap. Of the 1800 passenger cars in Siam, Dunlap estimates that there are about 200 north of Bangkok and about 125 in Siamese Malaya.

To determine the number of motor vehicles in Turkey at the present time is, of course, an almost impossible task. Reliable estimates place the number of automobiles in Constantinople and immediate neighborhood at 2380. Of this number 1180 are in civilian hands, and about 1200 are owned by the various troops in the region. Of the private automobiles some 380 are of American origin, while 270 were made in Italy, 150 in Austria, 120 in Germany, 120 in England, 90 in France, and 50 in Russia. The companies which have shown the greatest activity in this market are Fiat, Steyr, Ford, Chevrolet, Citroen, Berliet, Renault, and Peugeot.

Final Registration Figure for U. S. 12,364,377 Cars and Trucks

Gain of 1,858,747 over 1921 is 17.9 per cent. One motor vehicle for every 8.84 persons in country. Fees paid total $151,384,745. California climbs to second place, passing Ohio. Motorcycles in operation decrease. Future markets predicted by trend studies.

FINAL revised motor vehicle registration figures for the United States show a total of 12,364,377 cars and trucks in operation. Of this number about 10,857,000 are passenger cars and about 1,507,000 are trucks. The segregated car and truck figures are only approximate, however, as entirely accurate data are not available. There is one car for every 8.84 persons in the country.

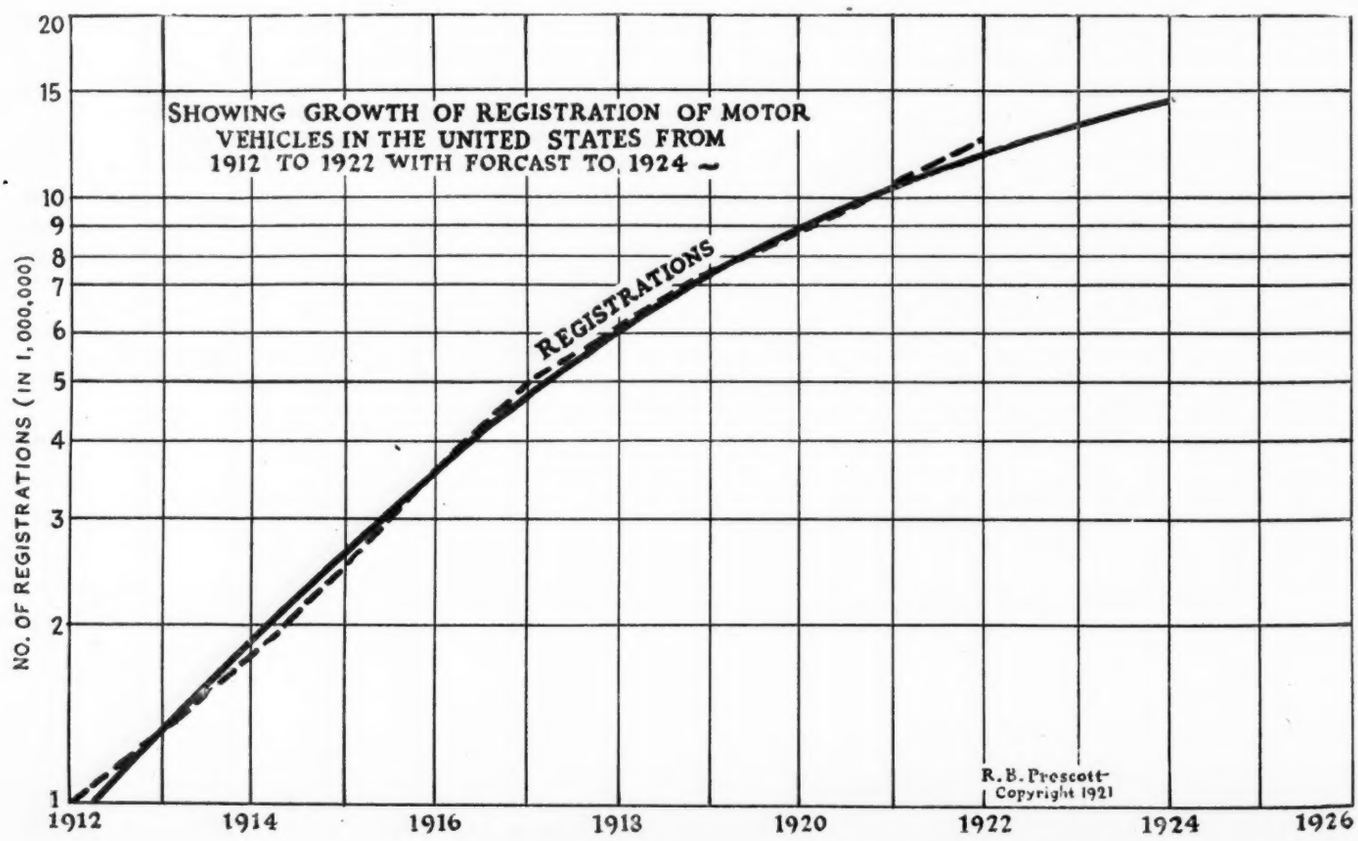
A gain of 1,858,747, or 17.9 per cent, is recorded over the 1921 total. Every state contributed to the increase. Fees paid by motorists amounted to $151,384,745, a gain of some $30,000,000 over the previous year. Motorcycle registration has dropped again, the 1922 total being 193,495 as compared with 207,930 for 1921.

These figures show no radical change from the preliminary data published in Automotive Industries of January 11. Perhaps the most important difference is the advance of California to second place in total registration. The final figures show that it has pushed Ohio out of the position behind New York, which Ohio has held for many years.

New York still leads the list with a registration of 1,002,293, while its actual gain of 190,262 was the largest to be recorded. District of Columbia made the greatest percentage gain, with 38.37, followed by Arkansas and California with 28.14 and 27.92, respectively.

Despite the unexpectedly large increase in car and truck registration during 1922, the predictions made by Automotive Industries at the beginning of the year came within 3½ per cent of being accurate for the country as a whole.

An accompanying table shows the prediction made at the beginning of last year as compared with the actual registrations compiled at the end of the year. The territorial prediction for the West North Central farm states was 16 per cent too high, but in all but two out of nine



geographical divisions the percentage of variation was less than 10 per cent. The variation in the farm states reflects the subnormal buying of the farmer during 1922.

Predictions Based on Normal Trend

It should be understood that these predictions are made on the basis of a normal trend. Variations from that normal may be expected as business conditions change from time to time in various parts of the country. These variations may be interpreted as measures of economic fluctuation in the territories involved.

This comparison of predictions and results shows how a study of trends can be used in making market studies and judging future sales possibilities. While the trend predictions involve certain variables, they do give a much closer approximation of probable future occurrences than is likely to be obtained from a less specific study. In every case, however, statistical phases of the trend study have been correlated with current economic and business conditions in making the various predictions.

The percentage of registration by states constitutes another valuable trend survey. The accompanying table showing the percentage distribution of motor vehicles by States is printed for the first time.

It shows that there is little variation from year to year in the percentage of total registration possessed by any given State. Michigan gives a good example. The percentage of total registration possessed by that State has not varied more than 8 per cent in 11 years. New York has varied less than 4 per cent, California less than 5 per cent, and Texas less than 3 per cent. These States are typical.

It is logical to assume on this basis that the approximate registration for each State during the coming year can be determined within 10 per cent by applying to the total registration prediction figure the percentage indicated for any particular State.

Each year there is a noticeable increase in the quantity and quality of registration data available for market analysis work. Much of these data has been privately developed, but better figures are being put out by the various States as well.

In all but five States segregated car and truck figures now are available. Separate motorcycle figures are compiled in every State. Many States have begun to publish county registrations, thus giving to the industry market analysis material of considerable value. Fourteen states now publish registrations by counties, according to a survey just completed by AUTOMOTIVE INDUSTRIES. These states are: Alabama, Arizona, California, Georgia, Idaho, Indiana, Kansas, Nebraska, New Hampshire, New York, Oregon, South Dakota, Texas, and Washington.

Lack of standardization in state registration practice, however, still makes it hard to interpret some of the data. The definition of a truck or commercial vehicle varies from state to state. Some states even classify all pneumatic-tired vehicles together, thus rendering the solid-tired vehicle figures practically useless as a truck figure. Varying classifications of tractors and trailers complicate the situation further, so that the segregated car and truck figures are by no means accurate.

Motorcycle manufacturers did not profit by the boom in domestic business during 1922 as did the car and truck builders. Registrations for the two-wheeled vehicles took another drop, as they did in two previous years.

The American motorist continues to pay an increasing sum for the operation of his vehicle. While registrations increased 17.9 per cent last year, fees paid by motorists

Registration of Motor Vehicles

Alabama	26.68
U. S.	8.84

increased about 24 per cent. This indicates that taxes per vehicle are higher than before.

Two facts stand out from the analysis of registrations this year: First, total motor vehicle registration for the United States can be predicted with a reasonable degree of accuracy, so far as practical business needs are concerned. This is highly important in connection with current market studies being made by various companies.

COMPARISON OF ACTUAL REGISTRATION DECEMBER 31, 1922, WITH NORMAL FORECAST MADE BY AUTOMOTIVE INDUSTRIES ONE YEAR AGO

	Actual Registration	Normal Forecast	Actual Difference Between Forecast and Actual	Percentage Difference Between Forecast and Actual
United States	12,357,000	11,930,000	Plus 427,000	Plus .035
Upper New England	184,000	173,000	Plus 11,000	Plus .060
Lower New England	672,000	611,000	Plus 61,000	Plus .091
Middle Atlantic	2,168,000	1,965,000	Plus 203,000	Plus .094
East North Central	3,086,000	2,895,000	Plus 191,000	Plus .062
West North Central	2,080,000	2,414,000	Minus 334,000	Minus .160
South Atlantic	1,094,000	1,150,000	Minus 56,000	Minus .051

*Estimated. **Not segregated.

Second, the percentage of total registration possessed by each State varies but little from year to year.

State legislatures are meeting throughout the country and there is every evidence that the motor vehicle will play an important part in many legislative sessions. The vehicle taxes paid by car owners is only a small part of the total contribution made by the automotive industry to State and national budgets. Many States have imposed gasoline taxes which exact a heavy toll from drivers. In addition to these special taxes as motor vehicle owners, the drivers pay all the ordinary citizen taxes.

The heavy special taxes paid by automotive manufacturers must also be considered in any discussion of the automotive contribution to government treasuries. The vehicle tax figures shown in the accompanying table are but a small part of that gross total.

The substitution of a fuel tax for the customary and almost universal tax based on horsepower rating continues to be agitated. Sponsors for this new form of tax levy believe that the present system is far from just in that the users of the public highways do not pay in proportion to the service received.

American Passenger Car Chassis Design Shows Refinement of Detail

Six-cylinder models increase with corresponding decrease in fours. Semi-floating type rear axle makes big gain. Multiple-disk clutch leads over single-plate type. Chain driven camshafts in greater favor. Number of different makes declines.

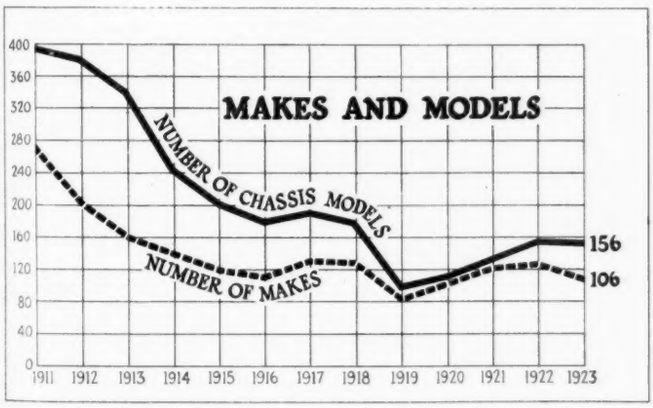
A SURVEY of American passenger car specifications for the year 1923 reveals no fundamental changes. Radical changes in design would hardly be expected with production around the two million mark, and such changes in design as are noted are chiefly in line with trends which were obvious several years ago. Chassis design has reached the place where trend lines flatten out and look for the most part as if they would stay that way for some time to come.

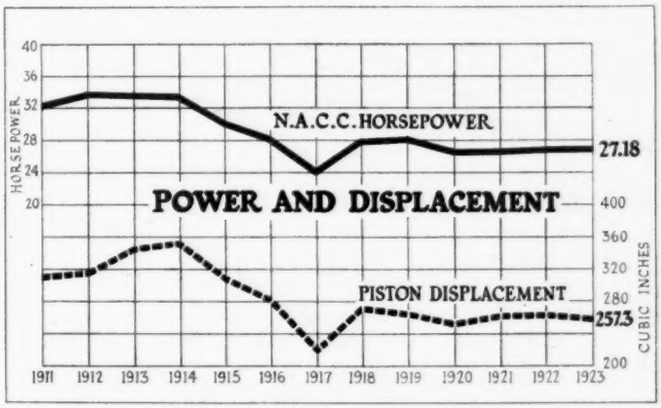
The accompanying charts show the yearly changes in certain specific elements of design. The percentages given are based upon the number of different models using the particular type of construction in question and do not have any reference to the number of cars produced with that construction. This explanation should be borne in mind when studying the charts.

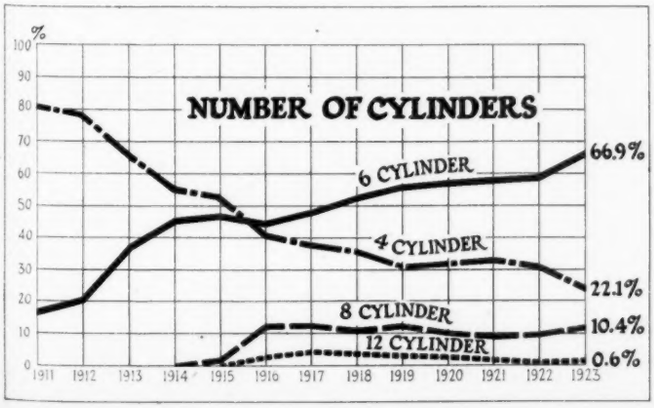
The figures do show in how great favor the various elements of design are held by American passenger car manufacturers, and therefore may be said to represent a vote of the industry as a whole.

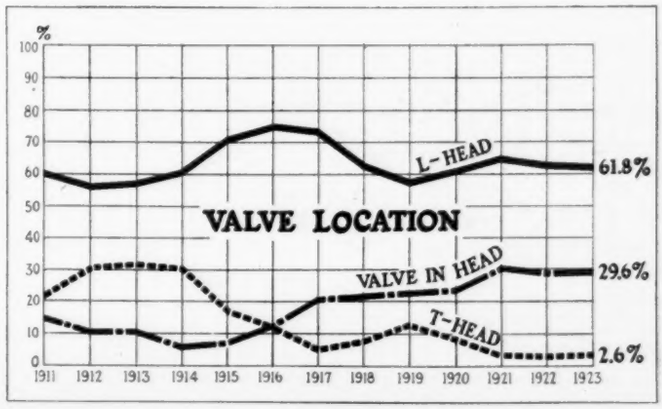
This year there are 106 makes and 156 models listed, as against 123 makes and 159 models last year. With the decrease in number of makes a corresponding decrease in number of models might be expected, but the number has remained approximately the same. This may be explained by the fact that several manufacturers of four-cylinder cars have added six-cylinder models to their lines and by the fact that a complete compilation of models with varying wheelbase lengths is given.

Data show that the percentage of six-cylinder models has increased from 59.1 per cent to 66.9 per cent, making a greater gain than at any time in the last four years. As the percentage of eight and twelve cylinder models remains practically the same, the gain made by the sixes is at the expense of the fours, which have decreased from 30.8 per cent to 22.1 per cent. As mentioned before, the

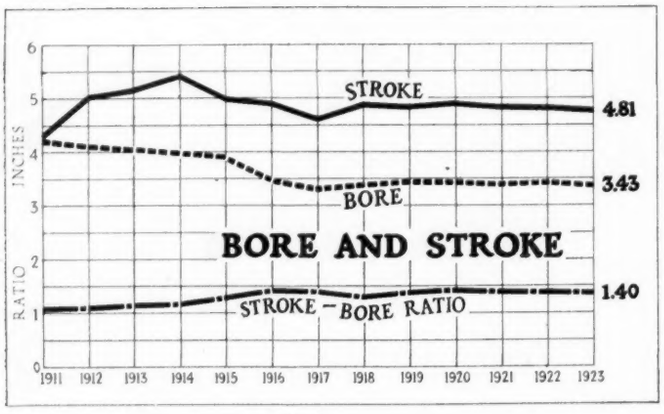


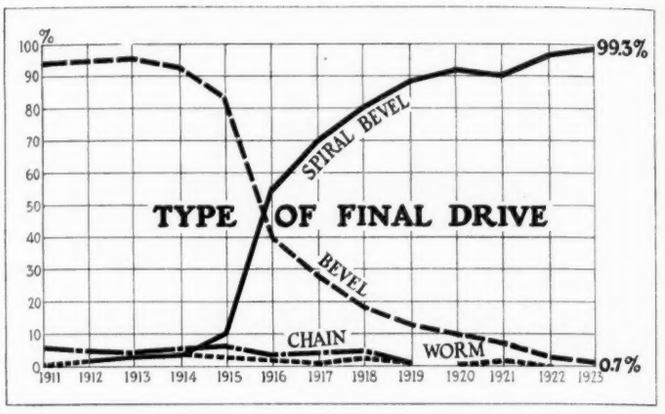


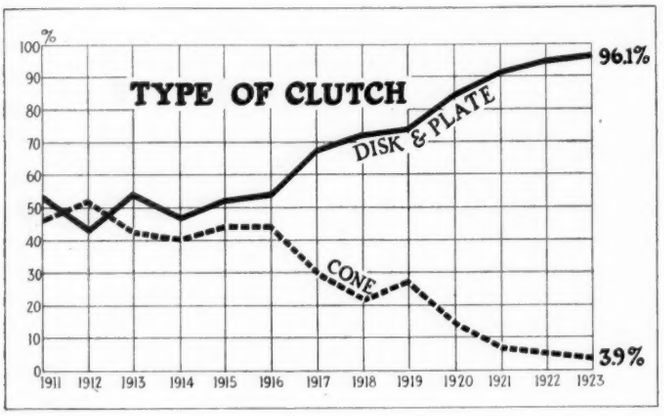


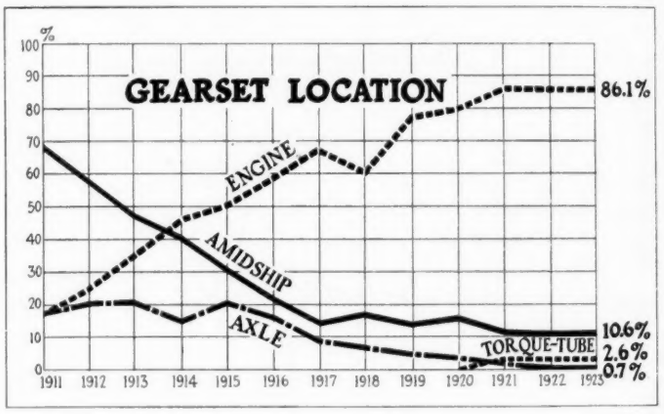


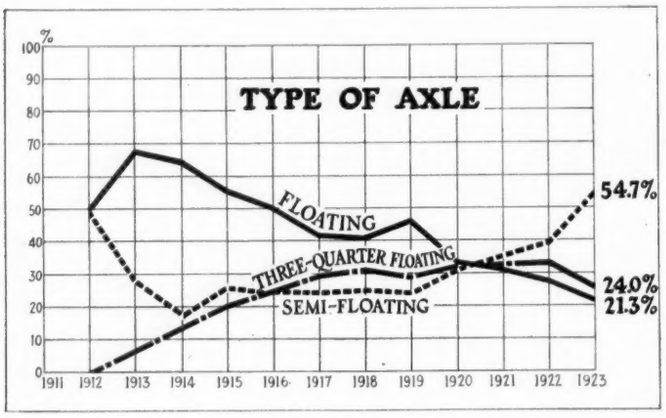
Tendencies in Passenger Car Chassis Design 1911-1923

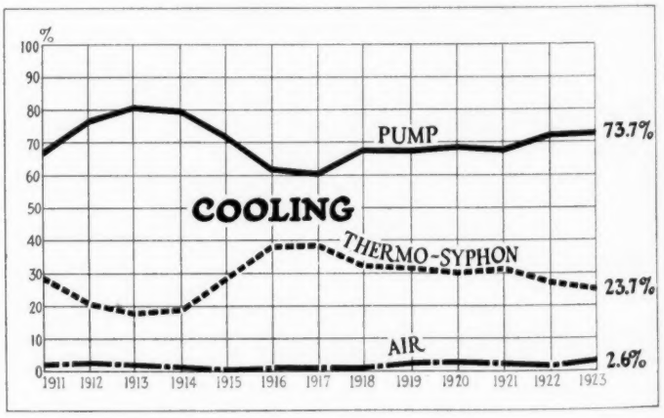


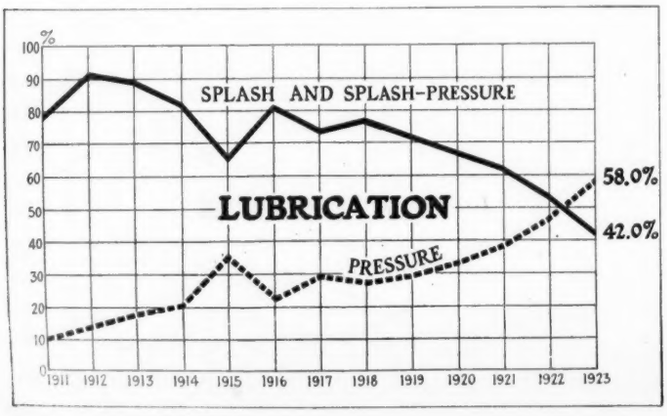


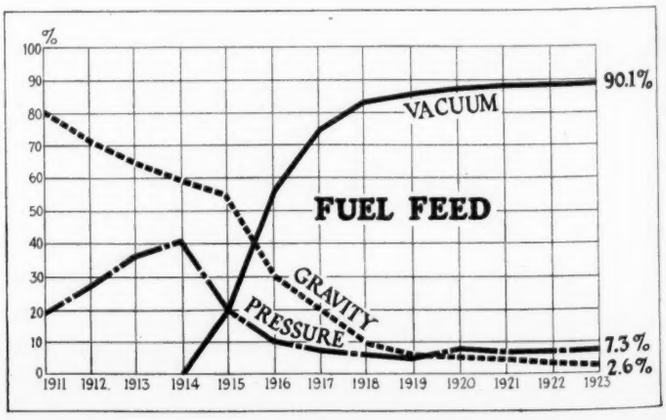












percentage figure is based upon the number of models employing the element of design in question and not upon the number of cars produced. Based on the number of models, the percentage of six-cylinder engines is 66.9, whereas on a production basis approximately 70 per cent of cars are powered with four-cylinder engines.

The change in average rated horsepower and piston displacement is so small as to be almost negligible. Both have remained almost stationary for several years.

Valve location shows very slight fluctuation. L-head and valve-in-head engines have decreased slightly and gain has been made by the sleeve valve type. The falling off in the percentage of L-head models is not due to a change in the trend but due rather to the decrease in the number of makes listed, which loss was largely absorbed by this group. The L-head type of engine still retains its lead with 61.8 per cent, and about the same percentage holds true in production.

Bore and Stroke Unchanged

The average bore and stroke, and consequently the bore-stroke ratio, remain approximately the same as last year. This year the average bore is 3.43, the average stroke 4.81 and the bore-stroke ratio 1.40. None of these items have varied to any degree since 1918.

An analysis of clutch types shows that the trend toward the disk and plate clutch, which has been continuous since 1914, remains the same. The disk and plate type taken together have increased from 94.2 per cent to 96.1 per cent in the last year, and the cone clutch has dropped to 3.9 per cent. If we carry the analysis further we find that the multiple-disk type has jumped from 36.5 per cent to 49.4 per cent, while the single plate type has decreased from 57.7 per cent to 46.7 per cent. Nearly all the multiple-disk clutches are of the dry variety.

In 1921 there was scarcely any difference in the popularity of the full-floating, three-quarter-floating and semi-floating rear axle. Last year the semi-floating type took the lead with 39.9 per cent, followed by the three-quarter-floating with 33.3 per cent. This year the semi-floating type is found on 54.7 per cent of passenger car models and the three-quarter type on 24 per cent.

The pressure system of lubrication, in which the oil is fed under pressure to the crankpin bearings as well as to the main crankshaft bearings, and in some cases even to the wrist pins and camshaft, has made great strides over last year and now leads over the splash and splash-pressure systems combined, the latter of which uses pressure to feed oil to the main bearings only and leaves the rest to splash. The relative standing is now as follows: pressure 58 per cent, splash and splash-pressure 42 per cent.

Spiral bevel final drive has come a little closer to universal application. It is now used on 99.3 per cent of all models. While this type of final drive covers almost all models, the straight bevel is still used on the Ford car and so is found on about 50 per cent of cars produced.

The different gearset locations hold practically the same relative position this year as they did last year and are as follows: unit with engines 86.1 per cent, separate unit amidship 10.6 per cent, unit with axle 0.7 per cent, and unit with torque tube 2.6 per cent.

Thermo-Syphon Cooling Loses Ground

Thermo-syphon cooling lost ground again this year while pump circulation and air cooling both gained. Seventy-three and seven-tenths per cent of models now have a water pump. The percentage of models using thermo-syphon cooling is only 23.7 per cent, but on a production basis well over 50 per cent of cars have this system.

Vacuum feed made a gain of 0.3 per cent at the expense of gravity and pressure feed systems and is now used on 90.1 per cent of car models. In spite of the fact that the percentage of gravity feed fell from 3.2 per cent to 2.6 per cent it is still found on about 51 per cent of cars when figured on a production basis.

Chain driven camshafts have gained again and are now found on about 35 per cent of models, whereas last year they appeared on about 28 per cent. In 1921 chain driven camshafts were used on only 19 per cent of the models produced.

Metal Universal Joints Predominate

This year metal universal joints are found on 78.2 per cent of passenger car models. Fabric joints stand second with a percentage of 19.2 while leather joints and combination metal and fabric have a percentage of 0.7 and 1.9 respectively.

The most popular type of steering gear is the worm and wheel. This particular type is furnished on 54 per cent of cars. The screw and nut type is used on 31.3 per cent of models. Worm and sector, planetary and bevel pinion and sector are found on models in the following percentages respectively: 12.7 per cent, 1.3 per cent and 0.7 per cent. On a production basis about 50 per cent of cars have the planetary steering gear due to the fact that this type is used by Ford.

Semi-elliptic front springs are well nigh universally used. This year the percentage of models using this type is 94.2. There still remains a great variation in the type of rear spring used. To be exact there are eight distinct types in use this year. The semi-elliptic type leads the field, as it does with front springs, and is found on 76.1 per cent of all models. The second most popular type of spring is the cantilever, used on 12.3 per cent of cars. The relative position of the remaining six types of springs is as follows: three-quarter elliptic 4.5 per cent, one-quarter elliptic 2.6 per cent, full elliptic 2 per cent, transverse semi-elliptic 1.3 per cent, platform 0.6 per cent and double transverse semi-elliptic 1.3 per cent.

Last year about 90 per cent of models had both sets of brakes on the rear wheels and the remaining 10 per cent had one set of brakes operating on the rear wheels and the other set on the drive shaft. This year the first mentioned group has fallen to 79.4 per cent and the locating of one set of brakes on the drive shaft has increased from 10 to 20.6 per cent. Last year there was only one American car using four wheel brakes, this year there are two. This European practice, the application of which has made great strides in certain Continental countries, has not taken firm hold here as yet.

Use of Disk Wheels Gains

The use of disk wheels has increased since last year and they are now found on 7 per cent of car models as standard equipment. This figure only takes into account the type of wheels used on the standard phaeton. If the sport models were considered there would undoubtedly be found a very great increase in the use of disk wheels.

Pressure gun chassis lubrication, which was unknown only a few years ago, is now found on about 60 per cent of all passenger car models.

The average gear ratio is 4.52, practically the same as last year, and the average wheelbase length remains at 122 in.

Passenger car chassis design this year stresses durability, silence of operation and accessibility. Changes of a startling nature do not exist and progress will be noted not in radically new ideas but in refinement of detail. This tendency toward refinement in design shows the recognition of service considerations and a determined effort to perfect that which is already developed in order that cars may deliver maximum performance in the hands of users.

ABBREVIATIONS:
†—On Standard Phaeton Models
‡‡—Taken from 1922 Specifications
††—Also fitted with Cont. 8R Motor

ENGINE:
HS—Herschell-Spillman
Cont—Continental
North—Northway
Lyc—Lycoming
Anst—Ansted
G. B.—Gray Beal
Dues—Duesenberg
Midw—Midwest
Weid—Weidely
Det—Detachable
Int—Integral
"L" H—At Side
"T" H—Opposite
"F" H—In Head and Side
S. T.—Sleeve Type
I. H.—Both in Head
C. I.—Cast Iron
C. or I.—Cast Iron or Aluminum
Al—Aluminum
St—Steel
S. S.—Semi-Steel
C-G—Combination Metal and Non-Metallic Gear
M. G.—Metal Gear
N-M-G—Non-Metallic Gear
IC—In Crankcase
OH—Overhead
Ther—Thermostat
Shut—Shutter
T. & S.—Thermostat and Shutter
Th. S.—Thermo-Siphon
Sp. Pr.—Splash with pressure to main bearings only
Press—Pressure to all bearings excluding wrist pins
Fl. Pr.—Pressure to all bearings including wrist pins
Pist—Piston
Ecc—Eccentric
Strom—Stromberg
Ball & B.—Ball & Ball
Till—Tillotson
John—Johnson
Scheb—Schebler
Own*—Also fitted with Holley and Kingston
Exh—Exhaust
Wat—Water
E. & W.—Exhaust & Water
Vac—Vacuum
Press—Pressure
Grav—Gravity
Bring—Berling
West—Westinghouse
N. E.—North East
A-K—Atwater-Kent
Scint—Scintilla
King—Kingston
Split—Splitdorf
Conn—Connecticut
*—Generator Wagner
Prest—Prestolite
Bat—Battery
Mag—Magneto

ELECTRICAL SYSTEM:
G. & D.—Gray & Davis
L-N—Leece-Neville
A-L—Auto-Lite

TRANSMISSION:
B. & B.—Borg & Beck
Mun—Muncie
Detl—Detlaff

M&E—Merchant & Evans
Detr—Detroit
Dool—Dooley
Mech—Mechanics
G-L—Grant-Lees
Durs—Durston
SP—Single Plate
MDD—Multiple Dry Disk
MDO—Multiple Disk in Oil
UwA—Unit with Rear Axle
UwE—Unit with Engine
UwTT—Unit with Torque Tube
SepU—Separate Unit
Univ.—Universal
Thiem—Thiemer
ThH—Thermoid-Hardy
Hart—Hartford
Norw—Norwalk
M—Metal
F—Fabric
L—Leather
MF—Metal Fabric
Flex—Flexite
Timk—Timken
Salis—Salisbury
Col—Columbia
F—Floating
¾ F.—Three-Quarter Floating
½ F.—Semi-Floating
RR—Radius Rods
S—Springs

RUNNING GEAR:
TT—Torque Tube
TA—Torque Arm
SB—Spiral Bevel
StB—Straight Bevel
Sp—Spur
½ E—Half Elliptic
¾ E—Three-quarter Elliptic
T ½ E—Transverse Half Elliptic
DTE—Double Transverse Semi Elliptic
¼ E—Quarter Elliptic
Cant—Cantilever
Ell—Elliptic
Plat—Platform
ExtRw—External Rear Wheels
IntRw—Internal Rear Wheels
Ext. DS—External Driveshaft
R&F—Internal Rear and Front Wheels
War—Warner
Gem—Gemmer
Jac—Jacox
Dit—Ditwiler
Mun—Muncie
Lav—Lavine
Woh—Wohlrab
W&S—Worm and Sector
W&W—Worm and Wheel
S&N—Screw and Nut
Plan—Planetary
BPS—Bevel Pinion and Sector
OC—Oil Cups
PG—Pressure Gun
GC—Grease Cups
AM—Automatic
A—Artillery
W—Wire
D—Disk
O—Optional

American Passenger Car

ABBREVIATIONS: Eisemn—Eisemann, **Splitdf**—Splitdorf, **Van Sic**—Van Sicklen, **‡Stew-War**—Stewart-Warner. These speedometers may be either of the Stewart or Warner type. **S. S.**—Straight Side, **C**—Clincher.

British Design Shows Marked Trend Toward Overhead Valve Engines

Unit power plants increase in number. Aluminum pistons common on new models. Four-cylinder 60-100 cu. in. engine dominates English industry. Splash lubrication makes gain in popularity.

By M. W. Bourdon

A MARKED increase in the number of overhead valve engines, more unit power plants in cars up to 12 hp. and a wider use of aluminum for pistons and rear axles are some of the outstanding features of British passenger car design for 1923. The accompanying specifications table also shows a large percentage of new models, mainly in the light car class.

There is a tendency to increase the average size of engine for small chassis, notwithstanding the fact that in a few cases new models have been introduced with smaller four-cylinder engines than any previously found in British cars. It is believed that there is a market for light cars with engines of any size ranging from 60 up to 120 cu. in. piston displacement, and while some makers have gone out for the larger sizes, others believe that there is a better scope in the smaller types.

A few firms have put forward six-cylinder light cars, but it is generally believed that these will find only a small demand. The average light car user is now looking for economy in first cost as well as in upkeep; refinement in running he is not prepared to pay for, and a four-cylinder engine does all he wants. The small sixes may appeal to a small class of people who have previously used luxury cars but are now compelled for one reason or another to cut down expenses.

Without question, the small car with a four-cylinder 60-100 cu. in. engine dominates the British motor industry. The 15 to 20 hp. five-passenger car has, nevertheless, a large following among makers and users, but it is not, strangely enough, the cheaper makes of this type which find the biggest demand.

The new overhead valve engines are without exception of the pushrod type, and the reason can be ascribed to popular preference. The advantages of the overhead camshaft engine at high engine speeds are admitted, but the drawbacks attached to its maintenance and its susceptibility to erratic lubrication have counted against it.

Almost half the number of new models have overhead valves; taking all models, 31 per cent have them, as compared with 24 per cent last year. No overhead camshaft engines have been dropped but pushrods have advanced from 54 to 77 per cent in overhead valve operation. F-head engines (inlet over exhaust) have been increased by Humbers adopting this type for three models, while additional models by Daimler and Argyll have increased the percentage of sleeve valves, the former using the Knight design and the latter the Burt-McCollum (single sleeve). L-head cylinders constitute 58 per cent of the total, a drop of 11 per cent from last year.

The four-cylinder engine continues to predominate, being used in 76 per cent of models, and in 96 per cent of these the cylinders are cast as a block. Sixes are block cast in 57 per cent, pairs being next in favor, threes being represented in 18 per cent, while separate cylinders with an overhead camshaft occur in one model, the Straker-Squire. The largest new model is a four, viz., the 30 hp. Vauxhall, and this has the original chassis with a new engine of 259 cu. in. The biggest new six is the Rolls-Royce Twenty (192 cu. in.).

Eighty-one per cent of engines have the cylinders separate from the crankcase, approximately the same as twelve months ago. Unit power plants are becoming more popular in the smaller sizes, being represented by 46 per cent of all models as against 28 per cent last year.

The increasing popularity of aluminum pistons is not evident by considering the percentages of all models; it is made known rather by their prevalance in new engines and of these approximately 46 per cent have the light alloy. The slipper type, which at one time showed signs of becoming popular, has receded from 5 per cent to 2 per cent in the year. The most popular type of aluminum piston is the straight-sided design with an axially split skirt and internal expansion ring.

Helical Gears for Camshaft Drives

The drives of camshafts in the crankcase have varied a great deal in popularity during the past few years. For a while gear drives gave way to the silent chain, the latter reaching the zenith of its popularity in 1921 when it was represented in 60 per cent of engines; helical gears were then receding in favor, though straight toothed pinions were gaining after being at a very low ebb. The latter have not continued to make headway, though they appear in a number of new models, and chain drives have receded in favor of helical gears.

Counterweighted crankshafts are gaining but are still rare. One maker only (Vauxhall) uses the Lanchester harmonic balancer.

Thermo-siphon water circulation has again increased, and 58 per cent of engines now have no pump; the increase is almost wholly due to the preponderance of small engines among the new models. Air cooling has made no headway and still appears only on two cylinder models of the light car class. Oil-cooled engines have slightly increased. Control of the cooling water temperature is to be found on appreciably more British cars

ABBREVIATIONS:

CYLINDER HEAD:
Det—Detachable
Int—Integral

VALVE ARRANGEMENT:
I.—At Side
I.—In Head
F—In Head and Side
S—Sleeve Type
T—At each side

CYLINDERS AND CRANKCASE:
Sep—Cast Separately
Unit—Cast in One Piece

PISTON MATERIAL:
CI—Cast Iron
Al—Aluminum

VALVE MATERIAL:
Ni—Nickel Steel
Ch—Chromium
C—Cobalt Alloy
Tu—Tungsten Steel
CCh—Cobalt Chrome
NCh—Nickel Chrome

CAMSHAFT LOCATION:
CC—In Crankcase
OH—Overhead

CAMSHAFT DRIVE:
Ch—Chain
HG—Helical Gears
SG—Spur Gear
SB—Spiral Bevel Gears
Ec—Eccentric Rods
BV—Straight both Bevel Gears
Wm—Worm Gears
CB—Chain and Bevel Gear

COOLING SYSTEM:
Th—Thermo Siphon
Pu—Pump
Ar—Air
Ol—Oil Cooled

LUBRICATON:
Sp—Splash
Pr—Pressure (in most cases to all crankshaft bearings)
PS—Pressure to main bearings, splash to other parts
FP—Pressure to all bearings

INLET MANIFOLD HEATED BY:
E—Exhaust
W—Water

FUEL FEED:
Pr—Pressure
Gr—Gravity
Vac—Vacuum

IGNITION:
Type:
M—Magneto
B—Battery
M. B.—Magneto and Batt

CLUTCH:
SP—Single Dry Plate
MD—Multiple Dry Disk
MO—Multiple Disk in Oil
Co—Cone
Ma—Magnetic Transmission
Fr—Friction Transmission
IC—Internal Cone

GEARSET LOCATION:
UE—Unit with Engine
SU—Separate Unit
UA—Unit with Axle
UT—Unit with Torque Tube

UNIVERSAL JOINTS:
F—Fabric
M—Metal
FM—Fabric and Metal
L—Leather

REAR AXLE TYPE:
FF—Full Floating
¾ F.—Three-Quarter Floating
½ F.—Semi Floating

FINAL DRIVE:
SB—Spiral Bevel
W—Worm
Bv—Straight Bevel

DRIVE AND TORQUE TAKEN BY:
TT—Torque Tube
Sp—Springs
RR—Radius Rods
TA—Torque Arm

SPRINGS:
¼—One Quarter Elliptic
½—Semi Elliptic
¾—Three-Quarter Elliptic
Ct—Cantilever
Tr—Transverse

BRAKES:
I—Internal
E—External
RW—Rear Wheels
FW—Front Wheels
P—Propeller Shaft

STEERING GEAR TYPE:
SN—Screw and Nut
WS—Worm and Sector
WW—Worm and Worm Wheel
RP—Rack and Pinion
Bev—Bevel Gear
Epi—Epicyclic Gear
M—Marles Cam Type

WHEEL TYPE:
D—Disk
HS—Hollow Pressed Steel Spoked
Wd—Wood
Wr—Wire
Opt—Optional

RP—Rack and Pinion
Bev—Bevel Gear
Epi—Epicyclic Gear
M—Maries Cam Type

WHEEL TYPE:
D—Disk
HS—Hollow Pressed Steel Spoked
Wr—Wire
Wd—Wood
Opt—Optional

than hitherto, some 10 per cent now having some arrangement of this kind.

Splash lubrication has increased considerably of late and is now used on 33 per cent of cars, the hollow crankshaft system having fallen from 54 to 44 per cent after increasing from 46 per cent in 1921. This change is not wholly due to the large number of light cars among new models, but more particularly to endeavors to reduce manufacturing costs when this end can be attained without loss of efficiency.

For all except engines of unusually high efficiency the hollow shaft system is certainly not a selling point, and is therefore not justified from that aspect. Full pressure systems, with leads up to the piston-pins, have moved up from 3 to 5 per cent. Circulating splash with pressure leads to the main journals and in some cases to the camshaft bearings has fallen from 22 to 18 per cent, catch-pits having been found as good as direct leads.

Gear Type Oil Pump Predominates

The gear type of oil pump still predominates, though it has given way from 72 to 64 per cent, the gain being in the plunger type, which now stands at 30 per cent; in three out of every five cases the plunger pump is located in the sump and is driven by an eccentric on the camshaft and linked rods.

The Zenith carbureter is used on over 50 per cent of British cars and in most cases is of the original, as distinct from the triple diffuser type. Hot air muffs are exceptional, though choke valves are coming to be more widely fitted. To assist vaporization, some form of water jacket is most generally favored, but only occasionally is this separate from the cylinder block. Sunbeam and one or two other makers (8 per cent of models in all) have a jacket around a separate inlet manifold, but by far the greater number merely arrange some portion of the induction tract in the cylinder block.

Gravity feed for the fuel is represented in 60 per cent of models, the vacuum system having fallen from 39 to 35, not because of dissatisfaction with it but by reason of the lack of space under the bonnets of the numerous new light cars and also on account of the lower cost of the gravity system.

Magneto ignition has given way but very slightly to the battery system during the past twelve months, having fallen from 92 to 87 per cent; battery alone occurs on the remaining 13 per cent, though it is also used as a second ignition on 3 per cent of cars. Two makers provide a second magneto, but these are on high speed efficiency "sport" models. Two-unit starting and lighting sets are found on 89 per cent of cars but there is a slight tendency to adopt the single unit and an additional maker of electric outfits (C. A. V.) has put one on the market for cars up to 12-14 hp.

The cone type of clutch remains in greatest favor for cars of all sizes, being used on 53 per cent, though the single dry plate has advanced from 34 to 38 per cent at the expense of the multi-plate.

Unit Power Plants Gain

As already mentioned, unit power plants have increased appreciably and now appear on 46 per cent of cars, the amidships location coming next with 42 per cent; the remainder are almost equally divided between the unit with torque tube and the unit with axle arrangements, both of which show a falling off.

Four speeds have increased 1 per cent, to 47, and this number of gears is to be found on light cars as well as on the larger sizes.

Open propeller shafts are found on 54 per cent of cars, and of these approximately 60 per cent have the Hotchkiss drive. The semi-enclosed system has increased from 4 to 6 per cent. The wider use of fabric disk joints continues, and 51 per cent of models have no metallic universal; of these 5 per cent have leather disks, while a further 10 per cent of cars have a fabric joint at the front of the propeller shaft and a sliding metallic joint behind.

Spiral bevels for the final drive again show an increase, though not so much at the expense of the worm, which is still found on 20 per cent of cars (11 per cent below the axle and 9 per cent above); it is the straight bevel which has receded (13 to 3 per cent). Full floating and semi-floating axles are almost equally prevalent—46 and 43 per cent respectively.

Axle casings of which a portion if not the whole is of aluminum have increased very considerably, for they occur on over 30 per cent of cars. The pressed steel double-banjo type of casing has increased, appearing on 16 per cent of models.

Half elliptic springs at back and front are used on 44 per cent of British cars, next in popularity being quarter elliptics for both ends (25 per cent), followed by full cantilevers at the rear with half elliptics in front (15 per cent).

Brake Lay-outs Varied

In brake lay-outs there are over a dozen combinations of types and positions. Internal shoes applying to drums on the rear wheels for both hand and pedal operated sets are most usual and have increased steadily since the war; this combination now appears on 72 per cent of cars. Cast aluminum shoes are increasing in favor, these being faced with fabric and having hardened steel contact plates for the cams. Cast iron shoes without separate facings are also in fairly wide use, but most makers still prefer cast malleable shoes with fabric facings.

Next in popularity to two sets of internal shoes applying to the wheel drums is the combination internal-on-wheels and external-on-gearset. External brakes on the wheels appear on only 10 per cent of cars. Only one British car has front wheel brakes as standard, and that is the smallest four-wheeler (the 7-hp. Austin), while Sunbeam is the only maker offering to fit them as an extra and that only on one model.

Worm and worm wheel steering gear occurs on 56 per cent of cars, worm and segment having receded 4 per cent, to 22. Means of adjustment for taking up backlash in the gears is more frequently found; sometimes it consists of eccentric bushes for the worm wheel shaft, while in other cases an adjustable thrust pin is provided for that shaft to take up axial play. Adjustment for the thrust bearings of the steering column occurs on approximately 60 per cent of cars.

Wheel Types Change

The disk wheel has receded slightly (from 29 to 27 per cent) after increasing rapidly in favor each previous year subsequent to the war. There is a growing prejudice against its appearance which is having some effect, but the main objection is its resonance, which has the effect of increasing the noise on indirect gear ratios.

The beaded edge (clincher type) of tire is used on 94 per cent of cars; this represents a gain for the straight-side tire, for the present is the first year in which any British car maker has standardized this pattern. Cord tires are on the way to becoming standard, for whereas twelve months ago they had hardly appeared in British car specifications, they are included today in over 50 per cent. The majority of both cord and fabric tires supplied are Dunlops (84 per cent), though Michelins are equally if not more popular with users as replacements.

French Car Builders Increase Number of Types

One-model program not carried out by any maker. Even Citroen has added sport type and is designing smaller two-seater. Magneto ignition regains popularity. Special carbureters used.

By W. F. Bradley

IN a technical review of French passenger-car development one may well include the products of Italy, Belgium, Switzerland and Spain, for while these countries have their individualities, the general lines of development are the same. Technically, European automobile construction falls into three distinct schools: British, German and French, each one with its distinctive characteristics. The number of passenger cars produced in Switzerland and Spain is too small to have any important influence on the whole, while the output of Italy and Belgium, although bigger, follows the same general lines as that of France.

The belief, which sprang up after the war, that there would be a specialization on one or a few types has not been borne out, and is further from realization now than ever. The only makers confined to a single model are those producing very limited numbers of unusually high-grade cars, and even among these there is a tendency to build a sport type as an addition to the normal touring chassis. Among those falling into this class are Farman, Hispano-Suiza, Excelsior, Sizaire-Berwick and Paulet.

Citroen, who set out with a one-model big-production program, has found it necessary to modify is by adding a sport type to his normal chassis and taking up the construction of a smaller two-seater. Among the big firms the tendency is toward an increased number of models: Renault has five distinct chassis types for passenger service only; Peugeot markets eight distinctive models; Panhard-Levassor has five types; Berliet has three; De Dion Bouton has four types, with sub-divisions increasing this number to six.

Piston displacement has decreased for the 1923 season. This change has been brought about by the invasion of the light-car field by firms hithertofore building bigger machines. Among those who have made this change are Voisin, Lancia, Hotchkiss, Minerva, Itala and Metallurgique. The type of car being produced in the biggest quantities is a four-cylinder having 91 cu. in. piston displacement maximum, nominally rated at 10 hp., with a four-seater open or closed body, the wheelbase varying from 100 to 105 in. The biggest producers of cars of this general type are Fiat in Italy, Citroen, Talbot-Darracq, De Dion-Bouton, Berliet, Peugeot, Delage, Lorraine-Dietrich and Peugeot in France. The 10-hp. four-passenger model represents approximately 75 per cent of the production of the above-mentioned firms.

> **"THE belief, which sprang up after the war, that there would be a specialization on one or a few types has not been borne out and is further from realization now than ever. The only makers confined to a single model are those producing very limited numbers of unusually high-grade cars and even among these there is a tendency to build a sport type in addition to the normal touring chassis."**

There is a fairly wide variation in the price of cars of this general class, the differences depending upon size and quality. The following prices are for the cheapest model four-passenger 10-hp. cars where alternative models exist, and include the State 10 per cent luxury tax applied to all pasenger cars: Citroen, 13,900 francs; Renault, 19,000 francs; Berliet, 19,850 francs; Fiat, 21,750 francs; Delage (chassis only), 21,150 francs; Talbot-Darracq, 23,000 francs; De Dion-Bouton, 24,000 francs; Panhard-Levassor, 24,900 francs; Voisin, 33,000 francs.

Large Light Car Field

Below the 10-hp. four-passenger car there is an important series of light two-seaters officially but erroneously termed "cycle cars." These are really diminutive cars, having all the features of big cars, with a piston displacement not exceeding 61 cu. in. To get the advantage of reduced taxation the "cycle car" is limited in weight to 771 lb. It is a difficult matter to get down to this limit while fitting a differential, maintaining a reasonable margin of strength, and adding such accessories as electric lighting and starting, and it is for this reason that Renault and Citroen, the two biggest makers of 61 cu. in. machines, have ignored the official weight limit. Apart from these two firms, the important makers of 61 cu. in. cars are specialists, including Salmson, Amilcar, Mathis, Benjamin and S.A.R.A. The cycle car as a machine developed up from the motor cycle has met with practically no success in France. Prices for 61 cu. in. two-seaters vary from 7,000 to 9,500 francs, State luxury tax included.

There is much more uniformity in French chassis design than is the case in some neighboring countries, and particularly in England. Features of design which appear to be open to discussion in England are unanimously accepted in France. Thus all cylinders are block cast, unit construction of engine and gearbox is 85 per cent, detachable cylinder head is 46 per cent, and front wheel brakes have in one year jumped up to 51.2 per cent.

The four-cylinder engine is in the immense majority of 81.7 per cent. There is a slight increase in the number of

small, high-grade sixes (10.8 per cent) and a dropping off in importance of eight-cylinder engines of both the V and straight-ahead type. The Knight engine maintains its position, being produced exclusively by Panhard-Levassor, Voisin, Mors and Minerva, and for one model by Peugeot. The smallest Knight engines are a Panhard 2.4 x 3.9 in. and a Voisin of 2.4 x 4.3 in. There are no other alternatives to the poppet valve engine.

This year shows an important increase in the number of overhead-valve engines, which now total 35.4 per cent of the whole. Considering each model as a unity, these engines are about equally divided between overhead camshafts and camshaft in the base chamber with push rods. The latter type is much more important from a production standpoint, and appears likely to still further increase in numbers. All the overhead-valve engines have concealed push rods, either with the rods going through the cylinder casting or hidden by a detachable plate.

With unit construction of engine and gearbox on 67 per cent of French models, the engine subframe has practically gone out of existence. Three and four-point suspensions are about equally represented.

Magneto Ignition Regains Favor

The magneto, which a year ago appeared to be very seriously threatened by generator and battery systems, has regained in favor and is now found on 89.6 per cent of French cars. Double ignition is only found in exceptional cases. The use of aluminum pistons shows a very important increase and is represented by 46.3 per cent of total number of models. In two or three cases magnesium pistons are supplied or are optional; these, however, are only fitted to special sporting models.

Camshaft drive is represented by 60.5 per cent pinions and 39.5 per cent silent chains. The latter system has lost favor during the year, owing, apparently, to the difficulty of maintaining the initial degree of silence. Including all four-cylinder engines, from the smallest to the largest, the percentage of two main bearings is 51.5; on 44.3 per cent three bearings are used, and on 4.2 per cent there are five bearings. If engines of 61 cu. in. and less are eliminated, pump-water circulation is in a majority, but if all engines are considered the percentages are 75.3 for thermo-syphon flow and 24.7 for pump circulation.

In the matter of lubrication the tendency is toward full pressure with a gear type pump. This is found on 57.6 per cent of all cars. The pump-circulating type, with either constant level troughs for the connecting rods or centrifugal rings, is to be found on 32.5 per cent., while the splash system with troughs for the connecting rod bearings is seen on 9.9 per cent.

There is a tendency to make use of specialists' carbureters. As, in many cases, the make of carbureter is optional, percentages are apt to be misleading. The make most extensively used is Zenith, with Solex second. In practically all cases the mixture is heated by the circulating water, with in some cases the main air supply passing through the valve stem chamber. Muffs from the exhaust for heating the mixture are found in very rare cases only. The vacuum system of fuel feed is the most popular individual type on French cars, and embodies 50 per cent of the whole. The gravity system is found on 43.8 per cent, most of these being small cars where only a small amount of fuel has to be carried. The pressure system only exists in a modified form with a small feed tank on the forward face of the dash, and is adopted by Italian makers, who claim that vacuum is unsatisfactory in the mountains.

Three-speed gear sets have increased at the expense of four-speed sets, the proportions being 27.1 for the three-gear combination and 65.5 for the four. Cars with less than three or more than four gears are 7.4 per cent of the whole. The improvement of three-gear boxes has been brought about by the increased ratio of power to weight on modern four-passenger cars, and by an additional number of high-grade luxury cars on which a fourth gear appears unnecessary.

"THE outstanding feature of French construction for 1923 is the adoption of front-wheel brakes. Whereas two years ago the number of cars with brakes on all wheels did not exceed four or five high-class models, figures for the current year show that in 51.2 per cent of models front brakes are either standard or optional and the range runs from the smallest to the biggest cars and includes the most conservative as well as the most advanced designers."

Metallic universal joints are in an immense majority. As a general rule fabric type universals are only found on the smaller and cheaper cars. There is an increased number of pressed steel welded axle housings. Spiral bevel is the most popular type of final drive, its proportion being 50.7 per cent; straight bevel represents 34.4 per cent and worm only 3.9 per cent.

Plenty of variety exists in the matter of rear springing. The half-elliptic has the strongest representation with 46.3 per cent, with the full cantilever, or combinations of the cantilever, responsible for 24.1 per cent. Other systems, comprising quarter elliptics, transverse, platform and coil springs total 29.6 per cent.

Concurrently with the adoption of unit construction of engine and gear box and the increased popularity of cantilever springing, there has been developed the inclosed propeller shaft with either spherical or fork attachment to the rear face of the gear box. As a consequence the number of cars on which the springs are made use of to transmit both the drive and the torque has dropped to 42.1 per cent.

Front-Wheel Brakes Biggest Feature

The outstanding feature of French construction for 1923 is the adoption of front-wheel brakes. Whereas, two years ago the number of cars with brakes on all wheels did not exceed four or five high-class models, figures for the current year show that in 51.2 per cent front brakes are either standard or optional, and the range runs from the smallest to the biggest cars and includes the most conservative as well as the most advanced designers. In France the most generally adopted type is the Perrot; in Italy the Isotta-Fraschini, or modifications of this type, are generally used, and Belgium is making the most extensive use of the Adex type. In the great majority of cases the front and rear wheel brakes are operated simultaneously by pedal the hand lever gives independent control of the rear brakes only, and the transmission brake is abolished. On cars which are not equipped with front wheel brakes, the tendency is to fit both sets side by side on the rear wheel drums.

All wheels are detachable, the only maker of importance using a detachable rim being Berliet. Numerically the steel disk wheel of the Michelin type is the most important. Wire wheels are usually confined to open cars and sports models. Except on the cheaper cars, the type of wheel is often optional, but whether wood, disk, wire or steel spoke, it is always detachable. Clincher bead tires are used exclusively, there being no maker in France, Italy or Belgium marketing a car with straight-side tires.

Reduction in Number of German Passenger Car Models

Majority of manufacturers concentrate on one type. Four cylinder L-head engines far in the lead. Magneto ignition found on almost all cars. Four wheel brakes appear on three models.

By Benno R. Dierfeld

A SURVEY of the German automobile industry shows 65 manufacturers producing 108 passenger car models. Of these 65 passenger car manufacturers 12 are also producers of trucks and the list contains three wheel as well as four wheel passenger car types. The practice of concentrating on one model is followed by 41 manufacturers.

Four cylinder engines are greatly in the lead. This type of engine is found on 81.3 per cent of all cars. Six cylinders stand second with 11.8 per cent and the remaining 6.9 per cent are two cylinder models found only on light cars and cyclecars.

Of the four cylinder engines 7 or 7.8 per cent have their cylinders cast in pairs, the remainder for the most part are cast in block. Four out of the 13 six cylinder models have their engines cast in two blocks; 2 are cast in three blocks and the remaining 4 are cast in one block; 16.4 per cent of all engines now have a detachable cylinder head.

Cast steel cylinders are used on three models; steel cylinders on four models of the Mercedes and aluminum with steel or cast iron liners appears on four models.

Aluminum leads as a piston material. It is found on 55.5 per cent, or a little over half, of all models. Cast steel pistons are used on 2.7 per cent of cars and cast iron is fitted on the rest.

The L-head engine tops the list with 77 per cent, followed by the F-head with 5.5 per cent and I-head with 1.75 per cent. There is one two-cycle engine on the market and Mercedes is producing a Knight engined model.

Chain leads in popularity as a camshaft drive with 37 per cent; spur gears have 29 per cent and helical gears 24 per cent.

Thermo-Syphon Cooling Predominates

Cooling is effected by thermo-syphon on 58.2 per cent of German passenger cars. Pump cooling follows with 37.3 per cent and last air cooling with 4.5 per cent.

The combined pressure and splash system of lubrication is most popular. Of the oil pumps used, 70.8 per cent are gear type, 15 per cent eccentric and 14.2 per cent piston pump.

The French Zenith carbureter still dominates the field. This carbureter is found on 34.5 per cent of cars. The German Pallas follows with 29.8 per cent; various German systems 24.8 per cent and cars equipped with their own make 10.9 per cent. Vacuum fuel feed holds the field with 46.8 per cent; gravity follows with 30 per cent; air pressure 15.8 per cent; exhaust pressure 4.6 per cent and the remainder are mixed systems.

Magneto ignition is used in almost all cases. Battery ignition is only found on one model.

Clutch systems are divided as follows: Leather cone 31.4 per cent; Ferodo cone 28.8 per cent; fiber cone 1.9 per cent; double cone 3.8 per cent; metal cone 3.8 per cent; disc in oil 18.3 per cent; dry disc 2.7 per cent; expansion clutch 1.6 per cent, and plate 7.3 per cent. A clutch brake is fitted to 56 per cent of all models.

Four-Speed Gearsets Favored

Gearset separate from the power plant leads the field with 76 per cent. It is a unit with the engine in 22.2 per cent of cars. In 1.8 per cent of cars the gearset is combined with the rear axle. This is also found in the Rumpler car in which the engine, gearset and rear axle are in combination. Four-speed gearsets appear on 77 per cent of cars; three speeds on 20.2 per cent and two speeds on 2.8 per cent. All gearsets are of the selective type.

Chain drive is used on four small car models and together with the Rumpler they constitute the sole exceptions to shaft drive. Drive with one joint leads in favor with two joint appearing on 10 per cent of cars. Dry disk joints now have 8.1 per cent of the field, a distinct falling off from last year. Propulsion and torque is usually taken by the propeller tube.

A three-quarter floating rear axle with ball bearings throughout leads in popularity. For final drive, bevel gear tops the list with 47 per cent, spiral bevel has 45 per cent, double bevel 5 per cent and worm drive 3 per cent.

Front springs are divided to type as follows: Semi-elliptic 88.8 per cent; quarter-elliptic 4.6 per cent; transversal 3.8 per cent and cantilever 2.8 per cent. Rear springs: Semi-elliptic 59.8 per cent; cantilever 24.5 per cent; quarter elliptic 6.3 per cent, three-quarter elliptic 3.8 per cent, and other systems 4.6 per cent.

Steering gears are located on the right side to the extent of 90 per cent. Screw and nut type lead with 53.1 per cent; worm and sector follows with 43.9 per cent and other systems with 3 per cent.

The customary braking system is to have the foot brake a transmission brake and the hand brake operate on the rear wheel. Sixteen per cent have both brakes acting on the rear wheel. Four-wheel brakes appear on three models; 83.2 per cent of the brake equalizers are of the balance beam type; 11.2 per cent cable and 5.6 per cent bevel differential. Water-cooled transmission brakes are found on two models.

American Trucks Approach Standard Design in Major Features

Specifications indicate only slight changes over last two years. Worm and internal gear types lose some ground while percentage of models using bevel gears and double reduction is increased. 1 to 1¾-ton and 2 to 3-ton models are the most popular sizes.

A LARGER number of models is listed in the table of truck specifications this year than formerly. Chassis models used exclusively for bus applications are given only in the table of bus specifications, but truck chassis which are sold also for use as bus chassis are listed in both tables. The total number of truck chassis listed is 534, as compared with 494 last year. This increase represents more models among the various manufacturers rather than a larger number of manufacturers. One hundred and fifty makes are listed this year, as compared to 153 in 1922.

Trucks of 1 to 1¾-ton and 2 to 3-ton capacity are the most popular sizes. Of the models listed 160, or 30.5 per cent, are in the 1 to 1¾-ton class and 177 chassis, or 33.8 per cent, are in the 2 to 3-ton class. Nearly 4 per cent of the models listed are ¾-ton trucks, 16 per cent 3½ to 4-ton inclusive, nearly 13 per cent 5 to 6-ton and 3.4 per cent 6-ton.

Indications that the important features of truck design are becoming more and more nearly standardized continue to multiply, as will be noted by reference to the curves giving a graphical presentation of truck design factors. It should be clearly understood that these curves, as well as the following percentage figures, refer to the percentage of models listed in the accompanying tables which employ a given type of construction and have no relation to the percentage of trucks actually produced which employ such construction.

In this connection it should be noted that several of the largest producers who make a majority of their own parts employ a different construction in some parts from that of makers who purchase their components in the parts field.

Of the models listed more than 99 per cent are fitted with four-cylinder engines. The Autocar Co. still lists its two-cylinder models and four companies, none of which is among the large truck producers, list six-cylinder models.

Cylinder Block Castings Unchanged

The tabulation indicates no appreciable change in respect to cylinder casting. Approximately three-quarters of the models listed have their cylinders cast in a single block, while the remainder, with one exception, have cylinders cast in pairs.

There is again this year a slight increase in the percentage of models employing unit power plants and a corresponding decrease in those having a separately mounted gearset. This would make it appear that the smaller number of parts and the advantage in production which usually results from the unit power plant arrangement more than offset the advantages of greater accessibility which are claimed for the separately mounted unit. Fifty-three per cent of the models listed have unit power plants and 44 per cent separately mounted gearsets.

Out of 511 models upon which data concerning the lubrication system employed are available, 237, or 46.4 per cent, report the use of pressure feed to all crankshaft bearings, while 24.1 per cent report the use of pressure feed to all bearings, including wrist pins. Seven per cent use splash only and 23.5 per cent use a combination of splash and pressure.

Multiple Disk Clutch Predominates

Only a slight relative change is to be noted in respect to the type of clutch employed. The dry multiple disk type still predominates by a wide margin but has lost some ground to the single plate type, which is used on 20 per cent of this year's models, as against 18.4 per cent last year. The figures on dry multiple disk clutches are 76 per cent this year, as against 77.8 per cent last year. Cone clutches are now used by less than 2 per cent of truck models and there is approximately the same percentage of multiple disk clutches running in oil.

Four-speed gearsets are used on a trifle over 62 per cent of the models listed—approximately the same condition which existed last year. Of the remainder, 35 per cent have three-speed gearsets, a slight gain for this construction, and the remainder, comprising about 3 per cent of the total, have five or six speeds.

All the trucks listed have water cooled engines, and of these nearly 86 per cent have pumps, a gain of about 2 per cent over last year. It would appear that the slightly greater simplicity of the thermo-syphon system is more than offset by the better cooling and smaller radiator usually required when a pump is employed.

Worm drive, which has been used on more than 60 per cent of all models since 1917, appears to have reached the height of its popularity last year, when it was employed on 72 per cent of the models listed. It is used by 68.3 per cent this year. Internal gear drive also shows a falling off from 16.9 to 13.3 per cent, though still holding the second place in popularity.

Next in order comes the bevel gear, the use of which has increased from 5.4 per cent to 8.3 per cent during the past year. The double reduction type, used by some of the largest makers, now occupies fourth place with 5.5 per cent, as against 1.8 per cent last year. Chain drive also shows a slight increase from 3.9 to 4.5 per cent of all models.

The vacuum type of fuel feed has shown a gain of about 5 per cent and is used now by 47.4 per cent of the models listed. The balance of those giving information under this heading all use gravity fuel feed.

Tendencies in American Truck Chassis Design

ABREVIATIONS:
*—Weight with Trailers
‡‡—Taken from 1922 Specifications

TIRE SIZE:
S—Solid
P—Pneumatic
C—Cushion
S*—Pneumatics Optional at extra cost
d—Dual

ENGINE:
Midw—Midwest
Cont—Continental
Weid—Weideley
Wisc—Wisconsin
Wauk—Waukesha
Herc—Hercules
H-S—Herschell-Spillman
Lycom—Lycoming
Det—Detachable
Int—Integral
I. H.—Both Valves in Head
"L" H—"L" Head
"F" H—"F" Head
"T" H—"T" Head
Th-S—Thermo-Siphon
Sp. Pr.—Splash with Pressure to Main Crankshaft Bearings
Press—Pressure to all Crankshaft Bearings excluding Wrist Pins
Fl. Pr.—Full Pressure to all bearings including wrist pins
John—Johnson
Ray—Rayfield
Strom—Stromberg
Scheb—Schebler
Stew—Stewart
Tillot—Tillotson
Press—Pressure
Vac—Vacuum
Grav—Gravity
Mon—Monarch
McC—McCanna
Cent—Centrifugal
Hydr—Hydraulic
Suc—Suction

ELECTRICAL SYSTEM:
A-K—Atwater-Kent
A-L—Auto-Lite
Conn—Connecticut
Dyn—Dyneto
Eisem—Eisemann
G. & D.—Gray & Davis
L-N—Leece-Neville
N. E.—North East
Split-Splitdorf
West—Westinghouse
***Opt**—Optional at extra cost
Mag—Magneto
Bat—Battery

TRANSMISSION:

German Truck Design

GERMAN truck manufacturers number 27 and they produce 70 different truck models. Of these 27 manufacturers, 8 produce one model; 2 firms make two models; 10 make three models and 6 firms produce four models. Trucks are built in the following capacities: One model has a capacity of .85 to 1.1 tons; five models have 1.85 tons capacity; fifteen models are of 2.2 to 2.85 tons size; 24 models have 3.3 to 3.85 tons capacity while 13 models have 4.4 to 4.85 tons capacity and 11 models have 5.5 tons capacity.

Four-cylinder engines are almost universal; 77.2 per cent of them have their cylinders cast in pairs and the remaining 22.8 per cent are cast in block. Only 10.4 per cent of models have detachable heads and 6 per cent have cylinders of welded steel or cast steel as used by the Daimler and Daag companies. Twenty-eight per cent of engines are fitted with light metal pistons.

The L-head type engine predominates with 57.2 per cent, the I-head follows with 21.4 per cent; 11.4 per cent of models have a T-head and the F-head appears on 10 per cent of models. The I and F-head types gained considerably over last year.

Crankshaft bearings are divided as follows: 78.6 per cent have three plain crankshaft bearings; 12.6 per cent have four plain bearings; 5.5 per cent have three ball bearings and 2.85 per cent have two and three roller bearings.

Camshaft drive is divided as follows: 66.3 per cent spur gears; 23.8 per cent helical gears and chain drive 9.9 per cent. This applies to cylinders with other than I-head construction.

Pump cooling is found on all models not obviously redesigned passenger cars. The belt drive fan is universal with the exception of the two Horch models which have chain drive with friction clutch.

Radiator cores are 87.6 per cent of the tubular type and 11.4 per cent are honeycomb. About 15 per cent of all models are equipped with sectional cores and practically all radiator casings are made of brass sheet. Cooling thermostats are used only on NAG trucks.

German truck manufacturers have abandoned altogether the simple splash system of lubrication. Seventy per cent of models have a pressure circulating system and 30 per cent have a combined splash and pressure system. Oil pump types are divided as follows: 77.2 gear pump, 20 per cent piston, 2.85 per cent eccentric.

It is interesting to note that 11.2 per cent of all models (among them the Daimler, Bussing and Opel) use their own carbureter system. Fifty-three per cent of all models use the German Pallas carbureter; 11 per cent use the French Zenith and the rest use other German equipment.

Vacuum fuel feed leads the field with 27.7 per cent. The remaining fuel feed systems are divided as follows: 23 per cent exhaust gas pressure; 21.3 per cent gravity; 20 per cent air pressure; 8.6 per cent combined gravity and pressure.

Shows Little Change

Ignition is almost exclusively by magneto and on about 80 per cent of models this is Bosch equipment. Spark control is in 65.7 per cent of cases by hand lever and automatic 24.3 per cent. In the remaining 10 per cent of cases the spark is fixed.

Lighting systems are 75.6 per cent electric Bosch equipment and the rest acetylene. The dynamo is almost always located at the side of the engine and is belt driven. Batteries are usually carried on the running board. Starting systems are used on 63 per cent of models, provision for it appears on 14 per cent of models and the rest are unequipped.

German truck manufacturers prefer the cone clutch. Forty-seven per cent of models have leather-lined cone clutches and 23 per cent have Ferodo lining. Double leather cone appears on 5.8 per cent models and metal cones on 4.3 per cent, while disk in oil appear 15.5 per cent and dry disk clutch is used only on the Hansa-Lloyd. Gearsets have four speeds and clutch brakes are used almost universally.

Gearsets separate from the power plant are found on 90 per cent of truck models and ball bearings are used on all but three models, which use ball and roller combined and one with roller bearings throughout.

Selective type gear changed by means of a lever on the right side is used on all models with one exception, that being a truck manufactured by the Lippische Werkstätten which has hydraulically operated gearshift operated from the steering wheel and employs front wheel drive.

Shaft drive leads in popularity with 71.5 per cent. Internal gear drive and front wheel drive appear once in each case and the remainder are chain driven trucks. A single joint and tube, taking up torque and propulsion is found most commonly. Final drive is divided as follows: about 80 per cent bevel gears; 12 per cent worm and 6 per cent spiral bevel; 44.3 per cent of all models have a reduction gear in the rear axle.

Cast steel wheels predominate for truck equipment; 78.3 per cent of models use this type; 17.4 per cent use wood wheels and 14.3 per cent mount disk wheels. Front wheel bearings are ball in the majority of cases.

The Mercedes type of front axle is used on 68.6 per cent of all models and the rest use the forked type.

The type of steering gear used is about evenly divided between the screw and nut, and worm and wheel types, generally not adjustable in either case.

German truck manufacturers prefer to use the external contracting transmission brake and internal expanding rear wheel brake. On only one model are both brakes placed on the rear wheels and four-wheel brakes appear on one model. The balance lever brake equalizer system is used on 84.3 per cent of models and the bevel gear differential follows with 10 per cent.

The use of semi-elliptic front and rear springs is universal.

Benno R. Dierfeld

Six-Wheelers Prominent in Current British Truck Design

Few new models. Motor bus developments of chief interest in present practice. More attention will be given to light delivery trucks in future. Solid tires for over 1 ton jobs.

By M. W. Bourdon

DURING the past two years the British truck industry has been at a very low ebb, not only by reason of the depression in trade generally, but also because the market has been asked to absorb the many thousands of Government surplus trucks and chassis. But comparatively few of these Government trucks remain to be sold, and brighter times are just ahead.

The state of the industry has not encouraged the introduction of new models, and the few new chassis that have been brought forward have remained comparatively unnoticed owing to the decision not to hold a Truck Show during 1922.

Up to the present only one British maker (Albion) has put forward a chassis complying more or less with the requirements of the War Department (as published in AUTOMOTIVE INDUSTRIES of Aug. 17 last). Albion, however, has departed from the specifications by retaining its special system of engine lubrication by individual pumps to each main bearing.

Six-Wheelers Best for Heavy Loads

The opinion seems to be widely held that increase of unit loads above 12,000 lb. or so is best cared for by six-wheeled vehicles. Hence we find a growing number of such vehicles. Severable available outfits are tractors designed to accommodate a two-wheeled pivoted trailer, while others are in the nature of conversion sets made up by truck body builders and truck dealers.

There is no inclination to design chassis for pneumatic tires for loads over one ton. The number of chassis for one-ton loads is very small, the most popular type at present being the 2-3 tonner, next to that being the 3½ to 5 tonner. All engines are four cylinder with one exception, a Halley six-cylinder model for four ton loads. Sixty-six per cent of four cylinders are cast in pairs, and there are very few examples of block cast cylinders with a bore of over 3½ inches; integral cylinder heads are used in 70 per cent of models.

Until 1919 a large proportion of cylinders had T heads. The percentage today stands at 6 per cent, as compared with 16.5 per cent last year. Overhead valves remain at 7 per cent. Sleeve valves and F head cylinders have also been stationary, while 84 per cent of all engines have L heads. There is very little variation in camshaft drives to record; chains are used in 31 per cent of models (as compared with 32 per cent last year), straight pinions in 20 per cent (23 per cent), a corresponding gain having been made by helical gears, which now stand at 46 per cent; 86 per cent of trucks have pump circulation, though the thermo-syphon system is used in examples of all sizes even up to 5 tonners.

For engine lubrication the splash (trough) system is the most popular (40 per cent), followed by pressure through a drilled crankshaft (35 per cent); only three engines have oil leads taken up to the small ends of the connecting rods. Aluminum pistons (7 per cent) show no gain. The Zenith carbureter is by far the most popular, being used on 64 per cent of models, next in favor being the Claudel (25 per cent). Gravity feed for the fuel appears on 88 per cent of models, approximately the same as twelve months ago; on 68 per cent of chassis the fuel tank is beneath the driving seat.

The cone clutch is still most popular, being used on 74 per cent of trucks, a drop of only 2 per cent, in favor of the dry and multi-plate patterns, respectively standing at 23 and 3 per cent. Unit powerplants show a gain of only 1 per cent, the amidship gearset appearing on 94 per cent of models. Seventy-seven per cent of chassis have four speeds with right-hand side control. The metallic type of universal joint for clutch coupling shafts and for propeller shafts has shown no further loss to the fabric disk pattern, which latter now comprises 21 per cent of joints of all types, but one or two prominent makers prefer leather instead of fabric for disk joints.

In respect of final drives, worm gearing has advanced still further, being used on 62 per cent of chassis as against 57 per cent last year and 52 per cent in 1921. Chain drive continues to recede, though several prominent makers still use it on all sizes. Double reduction gears have decreased on a percentage basis, though no maker has discarded them. Internal gear drives do not appear on any British trucks.

Semi-Elliptic Springs Universal

Semi-elliptic springs are universal, except that the Palladium truck chassis, when supplied for passenger work has superimposed cantilevers at the rear. Brakes usually consist of a set of hand-applied shoes within the wheel drums and an external transmission brake operated by pedal. Making an exception of two gasoline electrics, no British truck has external wheel brakes; 20 per cent have both sets applying to the wheel drums.

Worm and complete worm wheel steering gears are used on 51 per cent of chassis, the worm and segment type remaining at 41.5 per cent, the others being worm and nut. Nine per cent now have the steering wheel at the side of the engine; in 1.5 per cent of chassis it is above and in 4.5 per cent of models the arrangement is optional.

Continental Truck Design Stagnant

War vehicles still flood the market. Few new models brought out. Most extensive production in 3½ ton class. All models use magneto ignition. L-head type engines dominate the field.

By W. F. Bradley

CONTINENTAL truck design is still suffering from the war and after-war effects. So many thousands of American, French and Italian trucks have been thrown on the market, and are still being liquidated, that sales of new vehicles have been reduced to a very low figure, and in view of the slump new models are not being brought out.

The type of truck most extensively produced is a 3½-ton model, the 5-ton truck coming next in order of importance. During the last two years the French Government has sought to encourage the adoption of a 7½-ton truck, which is a type required for military duty. This effort has not met with any success, for the military type 7½-ton truck with a long wheelbase and big platform does not meet any civilian requirement. Where trucks of this capacity are used, it is for such work as hauling blocks of stone, where a short wheelbase and an appropriate type of body are necessary.

Steam trucks occupy an almost insignificant position in France, Italy and Belgium. There has been some attempt to adopt gas producer plants to existing trucks, but from a commercial standpoint the venture has not assumed any proportions. The four-cylinder gasoline type engine dominates the field, with 73 per cent of the engines having block cast cylinders. The L-head type engine, with fixed cylinder head, is in an immense majority. There are no T-head engines, while the Knight engine is used for truck service by only one firm.

In 70 per cent of the models, water circulation is by pump; in 30 per cent by thermo-syphon. No belt driven impeller systems are used on Continental trucks. With the exception of Renault models, radiators are at the front, and are generally of the finned type. There is an extended use, on heavy trucks, of a type of radiator with independent demountable elements, which makes it possible to shut off any element or even to remove it entirely while on the road. This type of radiator is insisted on by the War Department.

Universal Use of Magneto Ignition

Ignition is exclusively by magneto, generally with variable advance. On trucks of 3-ton capacity and upward it is not the general practice to fit a lighting set, although this is required on the latest type army vehicles, and it is partially because of this absence of electricity for lighting purposes that the position of the magneto has not been assailed for truck work.

There is a fairly extensive use of makers' own carbureters for truck service, contrary to the practice for passenger cars. Thus, of the big makers Berliet, Delaunay-Belleville, Fiat, Panhard, Renault and Saurer use their own carbureter, the others employing either the Solex or the Zenith. In practically all cases where the load capacity exceeds 2 tons engines are fitted with centrifugal governors operating on the throttle.

On 52 per cent trucks the full pressure lubricating system is used, while the remainder have pump oil circulation with either troughs for the connecting rods or centrifugal rings. The gear type oil pump is used in practically all cases.

Gearset Usually Separate from Engine

On 63 per cent of the total the transmission is mounted separately, while on 37 per cent it forms a unit with the engine. This indicates a slightly increased tendency toward unit construction for heavy trucks. It is understood that for 1½-ton trucks and less, where touring car practice is very prevalent, unit construction is in an immense majority. These small trucks, however, which are really offshoots of the passenger car, have been ignored in this review.

Four-speed gearboxes are used on all but six models, and of these exceptions four have three gears and two have five combinations. There is an entire absence of uniformity in the types of final drive, side chains, worm, bevel and spur, bevel only, internal gear and a final reduction by internal planetary gears in the rear wheels hubs, being among the systems in use. Saurer makes use of a single step down by bevel gearing for trucks having a load capacity as high as 7½ tons, but generally for these heavy trucks there is a double reduction either by bevel and internal gears, or, as on the newer Renaults and Berliets, with planetary gears in the rear wheel hubs. Side chains hold their position for heavy trucks and appear to be preferred by the military authorities.

All trucks drive to the rear wheels with the exception of the Latils, which either have drive to all four wheels or front wheel drive only, with the use of internal gears. Half elliptic springs are used exclusively for the front and in all but a few cases at the rear.

It is difficult in tabular form to show the proportion of solid and pneumatic tires, for in very many cases the equipment is optional up to 5 tons' useful load. The use of pneumatic tires is undoubtedly growing for heavy loads, the almost invariable combination being Michelin steel disk wheels employed in dual form at the rear with clincher bead cord tires of 155 mm. (6 in.) section. The biggest size pneumatic tire employed on the Continent has a section of 185 mm. (7½ in. roughly), but this has not by any means the same general use as the 155 mm.. tire. The straight side tire is not used at all in France, Italy or Belgium, and because of the moderate size of the pneumatics it is the invariable practice to have one size throughout with dual wheels at the rear.

[1]Made with 6-in. longer wheelbase for 3½-4 ton loads.
[2]Same engine used in heavier chassis with similar specification for loads of 5½ and 7½ tons, latter with driver at side of engine.
[3]Chassis for bus or coach work.
[4]Also rated for 6½ ton loads with longer wheelbase and lower gear ratios.
[5]Also rated for 1½ tons with longer wheelbase and lower gear ratios.

[6]Tractor of six-wheels.
[7]Also rated for 4½, 5½ and 6½ tons with longer wheelbase and lower gear ratios.
[8]Also made with electric transmission.
[9]Electric transmission.
[10]Chassis for 50-64 passenger bus.

Continental Gasoline Truck

ABBREVIATIONS:
(b) Front wheel drive
(c) Twenty tons on trailers
(d) Four wheel drive
(e) Also supplied with pneumatic tires 1085 x 185

TIRES:
S—Solid
P—Pneumatic
D—Dual

CYLINDER HEAD:
Det—Detachable
Int—Integral

VALVE ARRANGEMENT:
L—At Side
I—In Head
F—In Head and Side
S—Sleeve Type
T—At Each Side

CAMSHAFT DRIVE:
Ch—Chain
H. G.—Helical Gears
S. G.—Spur Gear
S. B.—Spiral Bevel Gears
Ec—Eccentric Rods
B. V.—Straight Bevel Gears
Wm—Worm Gears
C. B.—Chain & Bevel Gear

COOLING:
Pu—Pump
Th—Thermo Siphon

LUBRICATION:
Sp—Slash
Pr—Pressure in most cases to all crankshaft bearings
Ps—Pressure to main bearings, splash to other parts
Fp—Pressure to all bearings
M—Murray Mechanical Lubricator

FUEL FEED:
Pr—Pressure
Gr—Gravity
Va—Vacuum

GOVERNOR:
Cent—Centrifugal

IGNITION TYPE:
M—Magneto
B—Battery
M. B.—Magneto and Battery

CLUTCH:
S. P.—Single Dry Plate
M. D.—Multiple Dry Disk
M. O.—Multiple Disk in Oil
Co—Cone
Ma—Magnetic Transmission
Fr—Friction Transmission

GEARSET:
S. G.—Sliding Gear
U. E.—Unit with Engine
S. U.—Separate Unit
U. A.—Unit with Axle
U. T.—Unit with Torque Tube

UNIVERSAL JOINTS:
F—Fabric
M—Metal
F. M.—Fabric and Metal
L—Leather

DRIVE AND TORQUE TAKEN BY:
T. T.—Torque Tube
Sp—Springs
R. R.—Radius Rods
T. A.—Torque Arm
Fr—Fork

FINAL DRIVE:
S. B.—Spiral Bevel
W—Worm
B. V.—Straight Bevel
Ch—Chain
B. S.—Bevel and Spur (double reduction)
I. G.—Internal Gear
Pl—Planetary

SPRINGS:
All European trucks listed have semi elliptic springs front and rear with exception of Renault ¼ and ¾ ton models which have transverse rear springs.

BRAKES:
I—Internal
E—External
R. W.—Rear Wheels
F. W.—Front Wheels
P—Propeller shaft

STEERING GEAR:
S. N.—Screw and Nut
W. W.—Worm and Wheel
W. S.—Worm and Sector
W—Worm and Wheel or Worm and Sector

DRIVE:
R—Right **L**—Left

LOCATION DRIVER'S SEAT:
S. E.—Side of Engine
R. E.—Rear of Engine
O. E.—Over Engine

WHEELS:
C. S.—Cast Steel
Wd—Wood
D—Disk
H. S.—Hollow Pressed Steel Spoked
A. D.—Aluminum Disk
St—Steel

FRAME:
F. P.—Flitch Plate
P. S.—Pressed Steel
R. S.—Rolled Steel

(1) Four wheel drive with transverse sheets.

ABBREVIATIONS:
(b) Front wheel drive
(c) Twenty tons on trailers
(d) Four wheel drive
(e) Also supplied with pneumatic tires 1085 x 185

TIRES:
S—Solid
P—Pneumatic
D—Dual

CYLINDER HEAD:
Det—Detachable
Int—Integral

VALVE ARRANGEMENT:
L—At Side
I—In Head
F—In Head and Side
S—Sleeve Type
T—At Each Side

CAMSHAFT DRIVE:
Ch—Chain
H. G.—Helical Gears
S. G.—Spur Gear
S. B.—Spiral Bevel Gears
Ec—Eccentric Rods
B. V.—Straight Bevel Gears
Wm—Worm Gears
C. B.—Chain & Bevel Gear

COOLING:
Pu—Pump
Th—Thermo Siphon

LUBRICATION:
Sp—Splash
Pr—Pressure in most cases to all crankshaft bearings
Ps—Pressure to main bearings, splash to other parts
Fp—Pressure to all bearings
M—Murray Mechanical Lubricator

FUEL FEED:
Pr—Pressure
Gr—Gravity
Va—Vacuum

GOVERNOR:
Cent—Centrifugal

IGNITION TYPE:
M—Magneto
B—Battery
M. B.—Magneto and Battery

CLUTCH:
S. P.—Single Dry Plate
M. D.—Multiple Dry Disk
M. O.—Multiple Disk in Oil
Co—Cone
Ma—Magnetic Transmission
Fr—Friction Transmission

GEARSET:
S. G.—Sliding Gear
U. E.—Unit with Engine
S. U.—Separate Unit
U. A.—Unit with Axle
U. T.—Unt with Torque Tube

CAMSHAFT
In C—In Crankcase
Hel—Helical
S. G.—Spur Gear
M&NM—Combination Metal and Non-Metallic
N.-M—Non-Metallic
WATER CIRCULATION
Th. S—Thermo Siphon

PISTONS
C. I.—Cast Iron
Al—Aluminum
C or A—Cast Iron or Aluminum
Pist—Piston
CONNECTING RODS AND CRANKSHAFT
C. St—Carbon Steel
A. St—Alloy Steel

OILING SYSTEM
SP. PR—Splash with pressure to main bearings only
Press—Pressure to all bearings excluding wrist pins
FL. PR—Pressure to all bearings including wrist pins
Ecc—Eccentric
Pist—Piston

GOVERNOR
Stk—Stock
Opt—Optional
Cent—Centrifugal
Suc—Suction
*—Varies according to type of Bell Housing

American Stock Engine

*—Made in various wheelbase lengths
†—Weight without battery

TIRES
C—Cushion
S—Solid
d—Dual
P—Pneumatic

MOTOR
Unit with J. S.—Unit with jackshaft
On F. & R. Axles—On front and rear axles
Unit with P. S.—Unit with propeller shaft
Unit with R. A.—Unit with rear axle
G. E.—General Electric
West.—Westinghouse

CONTROLLER
Under S—Under seat
Under F—Under floor
Under H—Under hood
Steer. Col—Steering column

Many New Models in British Farm Tractor Field

By M. W. Bourdon

DESPITE the continued depression in the farming industry and the consequent slackness in tractor sales, there has lately been a certain amount of activity among British manufacturers in the way of introducing new models and modifying details of existing ones. The most noteworthy additions are those of the Fowler line, dealt with in the accompanying specifications table. Fowlers, who were originally large makers of steam traction engines, have hitherto confined their energies in the agricultural field to one model of self-contained motor plow and an internal combustion engined cable plowing set. But they have now supplemented this with three new motor plow models and a series of internal combustion engined plowing tractors. Saunderson, one of the oldest of farm tractor makers in England, has also introduced a new light model. This displaces a light-weight type which appeared for the first time in public at the Tractor Trials of 1920, and there gave quite a good account of itself. The latest model has an engine with two cylinders arranged at 90 deg., with overhead valves, and uses inclosed chain transmission from clutch shaft to gear shaft, as well as from the latter to the rear wheels.

The hollow crankshaft (pressure) system of lubrication is rapidly becoming universal in British tractors; all of the new Fowler line have this system, the four-wheel models having the pressure relief valve controlled by the vacuum in the inlet manifold. Another innovation consists in connecting the oil level to the ignition switch, with the result that the magneto is grounded when the oil level falls below the safety line. Gasoline is the standard fuel for this make, though kerosene vaporizers are fitted on demand.

Magneto ignition is universal, and the majority of makers use a cone clutch and spur gear final drive, though in several cases it is inclosed in a live axle casing. Frameless designs have gained by the appearance of the Fowler tractors, which embody this feature.

The demand for tractors in Great Britain—small as it has been of late—indicates that the light-weight machine operating three plows in light land and two in heavy soil is the most popular, which is due to the comparatively small size of the fields, usually between 20 and 40 acres.

Chain track machines are not much favored, and there is only one of this type now made in England, the Blackstone, which has a three-cylinder engine with kerosene fuel injected into the combustion chambers. Other makers, who offered creeper machines as well as the wheeled type, have discarded the former.

Practically all British agricultural tractors are now made for field work alone, the endeavor to comply with the national road laws by having both axles sprung having been given up. One maker offers spring suspension fore and aft if required, altering his final drive to make the rear suspension possible.

There is only a very limited demand for a garden tractor, and the Service self-contained plow is the only example among British products.

R—Rigid
S—Sprung
St. Tu.—Steel Tube
Pr. Sh.—Pressed Sheet

FORKS:
Spr—Springs
Rig—Rigid

BRAKES:
Exp—Expanding
Cont—Contracting
I. R. Rim—Internal Operating Rim on Rear Wheels
I. F. Wh.—Internal Operating Rim on Front Wheels
E. R. Wh.—External Rear Wheels
E. R. Rim—External Rear Rim

I. R.Wh.—Internal Rear Wheels
E. F. Wh.—External Front Wheels
I. Gear—Internal Gearset
K—Kick
P—Pedal

Acet—Acetylene
Elec—Electric

British Motorcycle Specifications

‡‡—Taken from 1922 Specifications

ENGINE:
I. H.—In Head
"L" H.—"L" Head
"T" H.—"T" Head
S. Slee.—Sliding Sleeve
Rot. Slee.—Rotating Sleeve
Gener—Generator
Inter—International
Full. & J.—Fuller and Johnson
Cir. Spl.—Circulating Splash
Hol. Crk.—Hollow Crankshaft
M. f. m. o.—Multi Feed Mechanical Oiler

TYPE OF ENGINE GOVERNOR:
Cent—Centrifugal
Elec—Electric
U. U. R. B.—Ungoverned Unit Regulated by battery

TYPE OF IGNITION:
Mag—Magneto
Bat—Battery

FUEL SYSTEM:
Grav—Gravity
Suc. L.—Suction Lift
Vac—Vacuum Tank

FUEL RECOMMENDED:
Gas—Gasoline
Ker—Kerosene
G. or K.—Gasoline or Kerosene
G-N. G.—Gas, Kerosene or Natural Gas

FIELD CONNECTIONS:
Comp—Compound
C. & S.—Compound and Shunt

AUTOMATIC STOPPING DEVICE:
A. H. M.—Ampere Hour Meter
V. & C. R.—Voltage and Current Relay
Curr. R.—Current Relay
Vol. R.—Voltage Relay
P. Q. F.—Predetermined Quantity of Fuel

BEARINGS:
P. & B.—Plain and Ball

Motor Boats in France Number 1,095

ALTHOUGH possessing a long coast line and a large number of navigable rivers, the use of the motor boat in France is very slight, the official figures showing that only 1095 craft paid taxes for the year 1921. The greatest number of boats is to be found in the Bouches du Rhone departement, which comprises the port of Marseilles. The Gironde departement, which includes the town of Bordeaux with more than 260,000 inhabitants, only possesses 92 motor boats. In the north the development is still less, for all the regions having a sea front on the English Channel, from Dunkirk to Cherbourg only total 49 motor boats.

Taxation on motor boats is based on the power of the engine, the formula being the same as that for automobiles. This tax has tended to restrict the development of the motor boat.

Design Features of British Marine Engines

By M. W. Bourdon

A MULTIPLICITY of models is the policy of British marine engine makers in general, and in one or two instances this is carried so far as to result in some of the types being made practically "to order" only. It is noteworthy, however, that the makers who immediately after the war brought their designs up to date and specialized on a comparatively small range of types have felt least the effects of the depression.

Quite a large proportion of makers favor the separately cast cylinder design, a plan which is desirable from a production standpoint when—as is so often the case—the range of models includes engines of the same bore and stroke with one, two, four and six-cylinders and sometimes with three also. The T-head cylinder is now used only on "heavy duty" models. There are one or two new overhead valve models and in each an overhead camshaft is used, this feature appearing on the engines designed for the National Lifeboat Institution.

Engine speeds for pleasure craft show a slight tendency to increase, and there is an increasing popularity of reducing gears between crankshaft and propeller shaft, especially for the heavier classes of boat and for towing or auxiliary installations. Several makers are now recommending reducing gears in order to obtain a higher propeller efficiency, the usual reduction being approximately 2 to 1. Unit powerplants are far more frequently seen than hitherto, but, despite this, by far the great number of engines are separate from the gear casings. In one case, that of the Brunton two-cycle two-cylinder, the reducing gear is incorporated in the crankcase.

A-Vee—Air Cooled Vee
TRVee—Water Cooled Three Row Vee
FRVee—Water Cooled Four Row Vee
Hand Crk—Hand Crank
Em & Hc—Electric Motor and Hand Crank
Elec Mot—Electric Motor
CompAir—Compressed Air
Gas M—Auxiliary Gasoline Motor
ProSwg—Propeller Swinging
SeL—Sea Level
Ail—Ailerons
Ele—Elevators
Rud—Rudders
A&R—Ailerons & Rudders
E&R—Elevators & Rudders
Opt—Optional
Var—Varies
**—Taken from publications
*—One extra seat provided
®—Cord dimension at root (tapers to tips)
††—Small wing used for bracing
+—Fuselage folds
*†—Wings detachable
‡—Bottom wings only
Φ—Total area of all surfaces
‡‡—At full throttle
§—Light load
2—Gloucestershire
1—English Electric
‡‡—Known in U. S. as Army Transport T 2. This machine has carried a load of 2000 pounds in excess of its fully loaded rating.

Foreign Airplane

Deeper Drilling and Better Geology Made Gasoline Plentiful in 1922

Overproduction due to temporary stimulus. More rapid recovery of petroleum does not indicate any wider reserves. Sources of oil move westward. Mexican production drops and domestic supply increases. Problem of better utilization yet unsolved.

By Joseph E. Pogue *

FROM the point of view of the automotive industry, the most important developments in 1922 in respect to petroleum, would undoubtedly include the following:

1. **The encroachment of salt water in the light-oil fields of Mexico made rapid progress and the production of crude petroleum in Mexico declined from a high of 666,000 barrels a day in January, 1922, to 400,000 barrels daily in December.[1]**
2. **The production of crude petroleum in the United States staged a remarkable and almost unprecedented increase, enlarging from 1,400,000 barrels daily on January 1, 1922, to 1,740,000 barrels daily on December 31.**
3. **In spite of a vigorous increase in the consumption of gasoline, the abundance of crude oil during the year stimulated an over-production of motor-fuel, with the consequence that the refinery price of gasoline declined at the approximate rate of ¼ cent per gallon per week throughout the last six months of the year and on December 31 reached a level almost coinciding with the low of 1921**
4. **The consumption of fuel oil was strongly stimulated during the year, with the result that refinery activity was keyed up in excess of gasoline requirements and crude petroleum was utilized at a faster rate than necessitated by the requirements of the automotive industry.**

Domestic Production of Crude Petroleum

The broad features of the crude petroleum situation in 1922, as compared with recent years, are summarized in Table 1. It is there seen that domestic production in 1922 increased 81,000,000 barrels, or 17 per cent; imports remained the same as in 1921; stocks enlarged practically 100,000,000 barrels, and domestic consumption expanded 54,000,000 barrels or 10.3 per cent. Thus it is apparent that 1922 was a year of marked overproduction for crude oil, although by the end of the year much better equilibrium between supply and demand had been attained than prevailed during the first three-quarters of the year.

This progress toward better equilibrium was brought about, as shown in Fig. 1, by a rapid growth of consumption accompanied by a drastic decline in imports, in spite of extraordinary increases in the productivity of domestic oil fields.

The acceleration in domestic production was apparently the result of more effective and widespread use of geology coupled with faster and deeper drilling. The presence of these new and potent factors in the production situation would seem to be clearly indicated by the size and productivity of the wells brought in during 1922 as compared with other years. As is evident from Table 2, fewer wells were drilled in 1922 than the yearly average for the preceding five years, yet the average productivity per well was over twice as large and the current rate of production was thereby proportionately increased.

This quickening in production does not necessarily signify a greater ultimate supply of petroleum, for no

[1] The statistics presented in this review were derived from the following sources: Data on crude petroleum from U. S. Geological Survey and American Petroleum Institute; refined products from U. S. Bureau of Mines; well data from Oil and Gas Journal; export figures from U. S. Bureau of Foreign and Domestic Commerce; prices calculated by the writer from quotations given in the National Petroleum News, and the Oil, Paint and Drug Reporter.

additional oil is thereby created. It merely means that we are learning to recover this supply more rapidly, with resulting expansion in consumption of fuel oil, or, in other words, waste of potential motor fuel.

However, it should be mentioned that many geologists and petroleum engineers are coming to believe that recent estimates of the unmined supply of crude petroleum, which place the recoverable volume at nine billion barrels, more or less, are too low, and the ultimate recovery will be found to be substantially larger. Certainly the recent rapid expansion of our productive oil fields both laterally and vertically tends to suggest that prior estimates of the unmined supply, if in error, are inclined to be too low than too large.

Yet any enlargements in the reserve through new discoveries, if present tendencies continue, are likely to be balanced by a corresponding growth in the consumption of fuel oil and retardation of progress toward efficient motor-fuel utilization, so that little net advantage will be gained, so far as the automotive industry is concerned.

The past year was marked by domestic oil-field expansion in four principal directions: The bringing in of several highly productive, light oil fields in Oklahoma; the opening up of a large potential production in Wyoming; the development of three remarkably productive pools in the Los Angeles basin of California, and the discovery of an area of gusher wells in Southern Arkansas near Smackover. These four regions, particularly Wyoming and California, offer prospects of much new production in 1923.

Imports of Crude Petroleum

As shown in Table 1 and Fig. 1 the imports of crude petroleum, that is to say the crude oil shipped from Mexico to this country, suffered a notable decline during the second half of 1922. This recession was occasioned by the invasion of salt water into the prolific Toteco oil pool near Tampico, whose production between early July and late September dropped to the extent of 200,000 barrels daily. This result was predicted in a review of the oil situation published in this journal on Feb. 16, 1922, where it was stated that "the life of the known fields in Mexico is limited, and the output of that country will shortly be considerably reduced pending the development of new productive areas, which, of course, will take time." Little can now be added to this statement regarding Mexico; its production has been cut nearly in half; no further drastic declines are immediately in prospect, but it appears that the flood of cheap Mexican oil that has depressed the American market in 1921 and 1922 is now a thing of the past.

The importance of the developments in Mexico can scarcely be exaggerated. For the past three years the United States has been dependent upon the Mexican oil fields for over a fifth of the crude oil required by the American petroleum industry. This proportion can now no longer be maintained. It is doubtful if Mexican shipments during 1923 will be able to provide more than an eighth of our requirements. The result, of course, will be much heavier drafts on the domestic resources.

The significance of this changed condition can best be conveyed, perhaps, by stating the gasoline content of the imported crude: During May, 1922, the gasoline content of the crude oil imported was equivalent to 33,000 barrels daily; in October this figure had dropped to 21,000 barrels, and owing to a shift toward heavier oils in Mexican production, the gasoline content will probably fall to 10,000 barrels daily within the next six months. This decline has already placed an additional burden upon the high-gasoline crudes in this country and was undoubtedly one of the factors responsible for the recent upward movement in the price of the better grades of Mid-Continent oil.

Output of Refined Products

The production of the principal products of petroleum —gasoline, kerosene, fuel oil and lubricating oils—increased substantially in 1922 over 1921, as shown in Table 3. Of particular interest is the increase of 996,000,000 gallons, or 19 per cent, that characterized gasoline, which,

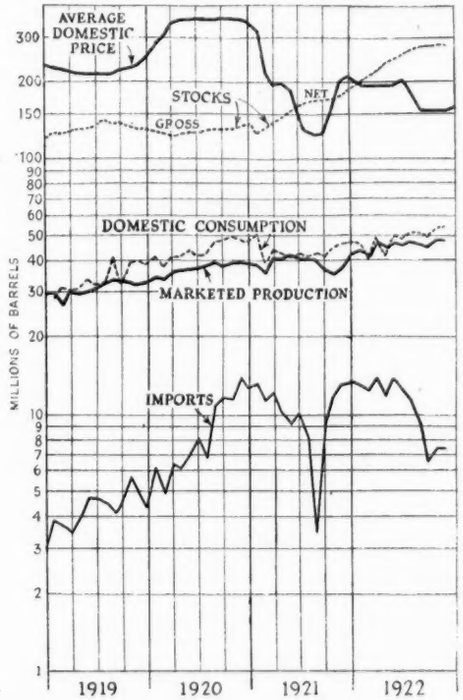

Fig. 1.—Trend of the crude petroleum situation in the United States by months, 1919-1922

of course, is quite in line with the rapid expansion of automotive transportation during this period.

Exports of petroleum products, with the exception of fuel oil, also displayed a fair increase in 1922 as compared with 1921, as is shown in Table 4. In view of the disturbed condition of Europe, this relationship emphasizes the essential character of these commodities. During the year, however, there was considerable expansion in foreign refining, especially on the part of the Anglo-Persian Oil Company, Ltd., so that the increase in exports did not fully register the growth in consumption abroad.

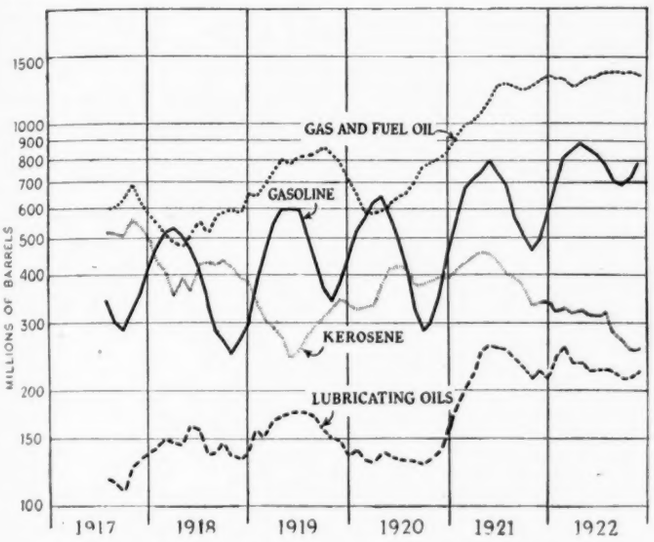

Fig. 2.—Trend of the stocks of the principal products of petroleum in the United States by months, 1917-1922. Monthly data prior to July, 1917, are non-existent

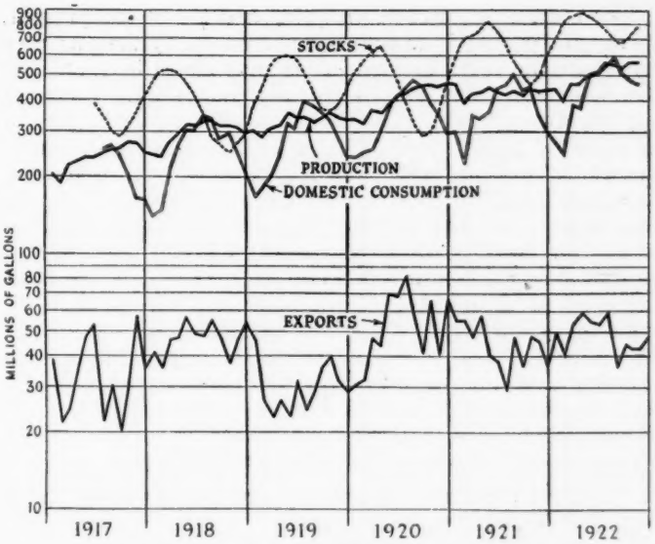

Fig. 3.—Trend of the gasoline situation in the United States by months, 1917-1922. This chart covers the entire period for which detailed gasoline statistics are available

The course of the stocks of refined oils, as depicted graphically in Fig. 2, is a good index of the supply-demand relationships pertaining to these products. It is apparent that, with the exception of kerosene, the large stocks built up during the depression of 1921 were not substantially reduced, and even the stocks of gasoline ended the year somewhat in excess of normal.

The Gasoline Situation

The trend of the gasoline situation by months during 1922 is depicted graphically in Fig. 3, on which the monthly data for five preceding years are entered to give perspective. The chart represents a record for this commodity over the entire period for which detailed statistics are available. The seasonal character of consumption and stocks is strikingly apparent, as well as the consistent upward trend of production and consumption during the period covered.

The most characteristic feature of 1922 is the manner in which production followed consumption upward during the spring and summer, thus leading to an over-supply of gasoline as indicated by the failure of stocks to be depleted to their normal level and the downward tendency of the price of gasoline after the first half of the year.

The volume of gasoline produced and the stocks present, in various parts of the country, are shown by months over the past two years in Fig. 4. It may there be seen that the manufacture of gasoline is well distributed throughout the United States and a local supply is available to all parts of the market. The great market of the North-Central States, however, finds it necessary to draw part of its supply from Kansas-Oklahoma and part from Wyoming. One feature of 1922 was the marked increase in gasoline production in Wyoming, which resulted not only in extensive shipments into the Middle West but left the local refineries with unusually large stocks of this product at the end of the year. Also the refineries of Oklahoma-Kansas and of Texas-Louisiana turned out gasoline in such quantity that the stocks in those regions failed to show their normal decline in late summer and ended the year in unprecedented volume.

During 1923 the ability of the refiner to win a growing percentage of gasoline from the crude oil consumed showed continued progress. This advance in refinery efficiency

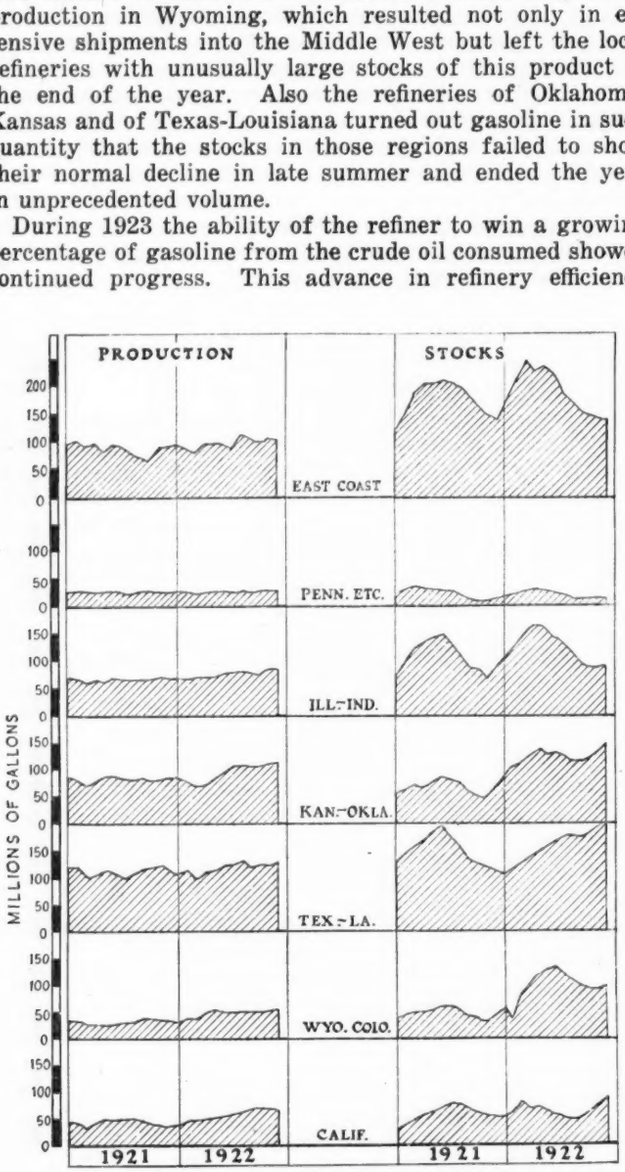

Fig. 4.—Production and stocks of gasoline in the United States by districts and by months, 1921-1922

was brought about through the development and extension of the art of cracking fuel oil into gasoline, as well as by means of extracting an enlarging volume of volatile gasoline from natural gas for blending with naphthas too heavy to be used alone as motor-fuel. In this way, 25.4 per cent of the volume of crude oil consumed in 1922 made its appearance on the market in the form of gasoline, as compared with 23.4 per cent in 1921, 21.8 per cent in 1920, 22.3 per cent in 1919, and 20.6 per cent in 1918. The rate of increase in the size of this extraction factor is very significant, for it indicates so far as the requirements of motor-fuel are concerned, that the supply of crude petroleum does not need to grow as rapidly as the rate of increase in the demand for gasoline.

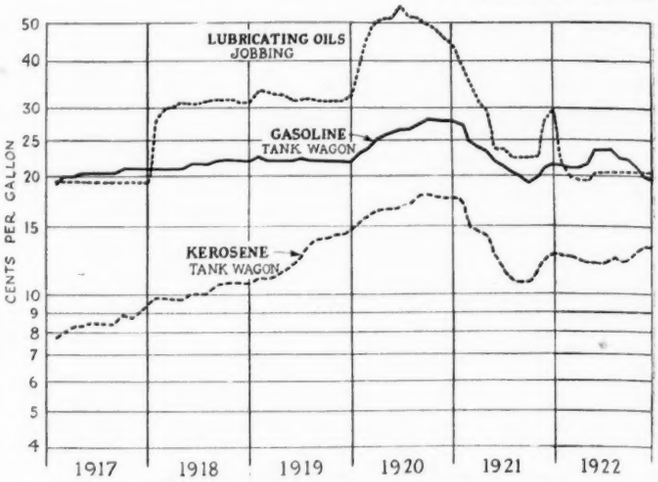

Fig. 5.—Trend of the average prices of gasoline, kerosene, and lubricating oils in the United States by months, 1917-1922

The year just closed was marked by the westward movement of the sources of gasoline, in that the production of the high-gravity crudes of Wyoming was almost doubled, while there was opened up in the Los Angeles basin a large output of crude oil with a gasoline content of around 20 per cent, much in excess of the older fields of California. One of the outstanding features of the present year is likely to be a heavy draft of these two newer sources of supply with the possibility of far reaching adjustments in the gasoline trade.

Endpoint of Gasoline

The tendency toward overproduction of gasoline that prevailed during 1922 naturally suggests that the quality of the gasoline supply had no occasion to deteriorate, so that it is not surprising to find that the two motor-gasoline surveys conducted by the U. S. Bureau of Mines in 1922 showed that the average endpoint of motor-gasoline in the United States was less than in 1921, materially less than in 1920, and even failed to register the usual seasonal increase in July as compared with January. Reference to Table 5 will reveal a generalized cross-section of the gasoline supply for several years in a number of widely separated cities so selected as to yield a representative sample of the entire country. It should perhaps be emphasized further that the volatility of the commercial supply of gasoline is a function of the ampleness of the supply; in years of overproduction the quality of motor-fuel will be better than in times of stringency. The reason that the endpoint of gasoline for the past two years has reversed its normal upward trend is because the heavier distillates were not needed to satisfy the demand for

motor-fuel; as soon as the supply again begins to run behind demand, the end-point of gasoline may be expected to increase and the problem of utilizing efficiently less volatile fuels will again become acute.

Prices of Mineral Oils

The year just closed witnessed considerable variation in the prices of mineral oils, but the average prices for the year for both crude petroleum and its principal products were less than the average prices for 1921 (see Table 6). This condition is quite remarkable in view of the fact that 1921 was a year of marked depression while 1922 was characterized by expanding business activity and one of the most rapid rises in commodity prices that this country has experienced outside of war-times. The explanation, of course, goes back to the overproduction of mineral oils as responsible for this anomalous condition.

The first half of 1922 was characterized by fairly stable prices for crude petroleum, rising prices for gasoline, and falling prices for kerosene, fuel oil, and lubricants. In the middle of the year the price of crude petroleum broke sharply, almost coincident with the passing of the Toteco Pool in Mexico to salt water, and the price of gasoline thereafter moved steadily downward to the end of the year. The price of fuel oil, stimulated during the middle of the year by the coal strike, weakened upon its settlement, while the price of kerosene moved upward during the autumn. The monthly course of prices for gasoline, kerosene, and lubricating oils over the past six years, is shown graphically in Fig. 5, where the recent changes may be seen in perspective.

Dec.	23.0	21.5	19.0	19.0	18.0	17.5	18.0	21.3	19.0

The year ended with the relative prices of the principal mineral oils, with the exception of kerosene, well below the general price level. Thus with the U. S. Bureau of Labor's index of the average price of all commodities registering 156 in December, the price of crude petroleum stood at 138, gasoline at 127, kerosene at 167, fuel oil at 111, and lubricating oils at 133.

The tankwagon price of gasoline is shown in some detail in Table 7 for a number of cities for the various months of 1922. It will be observed that the prices in the various cities moved uniformly upward during the first half of the year, and uniformly downward during the second half. It is interesting to find so consistent a trend in such widely separated points. The reason is that the tankwagon price tends to follow rather closely changes in the refinery price, and in the first half of the year the price at the refinery was dominated by a rapidly increasing demand, while during the second half of the year the controlling influence was an oversupply forcing down the market.

Conclusions

The past two years have been characterized by the tendency of the supply of crude petroleum to run ahead of demand, and in consequence no difficulty has been encountered in meeting the fuel needs of automotive transportation.

What promised to be a disastrous occurrence, the decline in Mexican production, was without immediate effect, for the oil-fields of the United States quickly displayed their competence to expand in output to a compensating degree. But the present highly stimulated productivity of American oil-fields should not be looked upon as a permanent or stable element in the situation; it was brought about by the utilization of geology on an unprecedented scale accompanied by a general tendency on the part of producers to drill for deeper sands. Better, deeper, and faster drilling has accelerated the speed with which the unmined supply of crude petroleum can be brought to the surface. The problem of better utilization is still relatively unsolved. We are learning to use our oil faster; we still need to learn how to use it better.

The automotive designer must cooperate with the oil producer and refiner if the best results are to be obtained over any extended period of time.

Value of Automotive Products Makes Big Gain in 1922

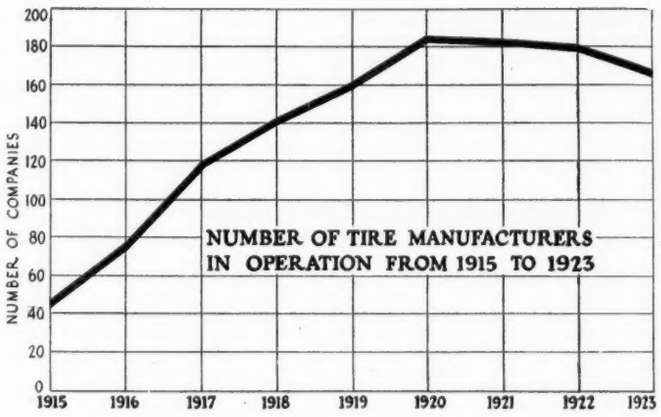
Increased production largely overcomes effect of price reductions. Passenger cars lead the field. General decrease in number of manufacturers. Consumption of raw materials and wholesale values of output show huge size of industry.

THE scope of the automotive industry and its importance in the industrial fabric of the country is well illustrated by the large wholesale value of its products, and the amount of materials which it consumes every year. In 1922 the wholesale value of the passenger car business alone aggregated $1,476,331,436. When the values of the truck and motorcycle output and production of replacement parts, accessories and tires are added to the passenger car figure a total wholesale value of $2,612,336,000 stands for the industry.

The industry's consumption of raw materials for 1922 was larger than ever before. Consumption runs as high as 35 per cent of the total domestic production in the case of one form of steel, and approximately 67 per cent of all leather produced in this country is consumed by automotive manufacturers. The percentage runs even higher in values than in volumes, and a more accurate conception of size may be had by viewing the industry from this angle. Accompanying tables show in detail the amount and value of various products used by this industry last year.

The total wholesale value of the various products of the industry for 1922 compared with the wholesale value for the year 1921 and the percentage gain are as follows:

	1921	1922	Percentage Gain
Passenger cars.....	$1,036,564,345	$1,476,331,436	42
Trucks	281,300,413	331,482,908	17
Replacement parts, accessories and tires	854,500,409	794,022,079	7 loss



The above figures are built up from government excise tax figures with the wholesale values for the month of December, 1922, estimated. Due consideration has been given to the value of exports which are not taxed, and therefore do not appear in excise tax figures. The wholesale value for parts, accessories, and tires does not include any of these items furnished as original equipment on new vehicles.

Production made far greater percentage gains in 1922 than did wholesale values. This is undoubtedly due to the fact that heavy reductions were made in prices of all products during the year, and were it not for this very great increase in production there would have been a general decrease in wholesale values all along the line.

The increased output of replacement parts, accessories, and tires in the year 1922 was not great enough to overcome the decrease in values, with the resultant loss of 7 per cent in wholesale value for the year as compared with 1921. The gain in part, accessory and tire wholesale values will be found in these items furnished as original equipment due to the enormous gain in production of passenger cars and trucks.

A comparison between the percentage gain in production and gain in wholesale values for the year 1921 and 1922 shows an interesting relation in the case of passenger cars and trucks as follows:

CONSUMPTION OF RAW MATERIALS BY AUTOMOTIVE INDUSTRY IN 1922

Material	Total Production	Automotive Consumption	Percentage Automotive Consumption
Lead	461,000 tons	8,500 tons	2
Tin	118,870 tons*	13,200 tons	11
Aluminum	375,000,000 lb.*	50,000,000 lb.	13
Nickel	.....	5,100,000 lb.	..
Copper	1,500,000,000 lb.	105,000,000 lb.	7
Plate glass.....	75,000,000 sq. ft.	35,000,000 sq. ft.	47
Leather	83,415,000 sq. ft.	56,000,000 sq. ft.	67
Imitation leather....	.....	106,000,000 sq. ft.	..
Upholstery cloth....	.....	10,000,000 yd.	..
Lumber	.....	667,732,340 ft.	..

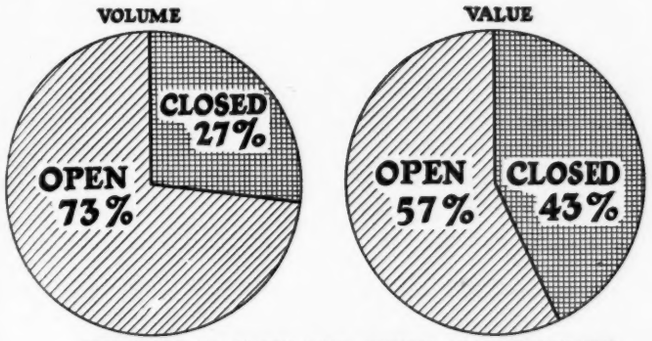
*World production



PERCENT OF OPEN AND CLOSED CAR PRODUCTION

	Percentage Gain in Production	Percentage Gain in Value
Passenger cars.....	55	42
Trucks	60	17

Percentage gain in value is based on total wholesale values built up from tax figures as a base.

The number of closed cars being produced as compared with the number of open cars is not great when considered on a basis of production, but from the standpoint of relative retail values the closed car looms very large, and its true importance to the industry becomes apparent. Reference to the accompanying chart will show the position of closed and open cars in the industry on a value and volume basis.

The consumption of raw materials by the automotive industry shown in the table is based on domestic production of materials unless otherwise stated. Lead production for the year is given as 461,000 tons, but there were 34,000 additional tons of imported lead available for consumption. The estimate of paints and varnishes only covers passenger car requirements, and does not include material used on trucks, parts, accessories, or repainting requirements.

Consumption of aluminum in this country last year amounted to 200,000,000 lb. Of this amount the automotive industry used about 25 per cent. It is significant to note that aluminum purchased by the industry is of high quality as shown by the fact that 25 per cent of the output consumed is valued at 50 per cent of the total output value. Cast aluminum constitutes approximately 85 per cent of the total aluminum consumption, and sheet aluminum the remaining 7,500,000 lb.

The number of manufacturers has declined in all branches of the industry with the exception of motorcycles which number remains the same in 1923 as in 1922. The accompanying chart shows the number of tire companies operating from 1915 to 1923. This does not indicate the number of factories or number of brands produced, as an operating concern combining smaller companies is counted as one manufacturer. The number of manufacturers in the various branches of the automotive industry in operation in 1922 and 1923 is as follows:

	1922	1923
Passenger car	123	106
Truck	153	150
Motorcycle	11	11
Tractor	69	57
Tire	180	167

Affiliated with the automotive industry are some 30 odd national associations and organizations. This number has remained more or less stationary for the past few years.

Consumption of Steel by Automotive Industry in 1922

	Total Production, Tons	Automotive Consumption, Tons	Percentage Automotive Consumption	Total Value Production	Value of Automotive Consumption	Percentage Value, Automotive Consumption
Shapes	2,643,000	32,000	12.1	$101,227,000	$1,226,000	1.2

1922 Export Sales Record Exceeded Only by 1920

Total of 185,039 American motor vehicles sent abroad in year, including large volume of parts, engines, tires, tractors, airplanes and accessories. Value of products shipped to foreign markets was —$136,557,354. Gasoline a big item. Year's statistics analyzed.

FINAL statistics for 1922 show that the foreign demand for American automobiles required a total of 185,039 passenger cars and trucks, thus establishing the assertion previously made that the year would be the second best in the history of the export section of the industry. Only 1920 rolled up a heavier volume of demand than last year, which was about double 1921, and somewhat in excess of 1919. With shipments expanding month by month, and with the last part of the year much better than the earlier months, it seems probable that 1923 will equal if it does not exceed the sales record of 1920.

When the statistics for 1922 are analyzed to determine what was accomplished and what gains were made, the industry finds a surprising volume of trade. It is doubtful if any observers would have predicted twelve months ago that nearly 200,000 American made cars and trucks would be sold abroad during the year, but the year brought a steadily expanding overseas market for the transportation units which the American industry builds.

Careful examination of all the items and all the statistics in the export picture are essential if they are to be properly understood. The total of 185,039, for instance, includes shipments from the United States and Canada, together with the foreign assembly of Ford vehicles. It comprises both cars and trucks, which can not be separated because of the fact that Ford has not seen fit to give such detailed information in regard to his foreign assemblies. The basic figures making up this total, however, are 66,790 passenger cars and 11,445 motor trucks shipped from the United States, 35,382 passenger cars and 2564 motor trucks from Canada, and 68,858 Fords assembled in the plants in England, Spain, Denmark, France, Argentina and Brazil. As the industry understands, these Fords do not show in any of the official United States or Canadian export statistics as completed vehicles, but rather as parts, engines, etc. The reason for adding the Canadian exports to the American totals is that Ford ships completed vehicles from his Canadian plants to the British territories which grant preferential tariff treatment to products from the Dominion and likewise because General Motors, since the latter part of 1921, has shipped Chevrolet and Buick cars from its Oshawa plant to nearly every foreign territory, having concentrated its export production at that plant. The Canadian figures pertain only to Ford, Chevrolet and Buick, which naturally must be considered in any detailed analysis of export trade.

Cars and trucks form only a part of America's international trade in automotive products. While car and truck shipments are the leading factor in this great and growing business, account must be taken of much other equipment, which the world also buys from the United States. When such a compilation is made, including parts, automobile and gas engines, tires, motorcycles, airplanes and airplane parts, farm tractors, storage batteries (of which 90 per cent or more are required for automotive use), magnetos, spark plugs, etc., and isolated electric

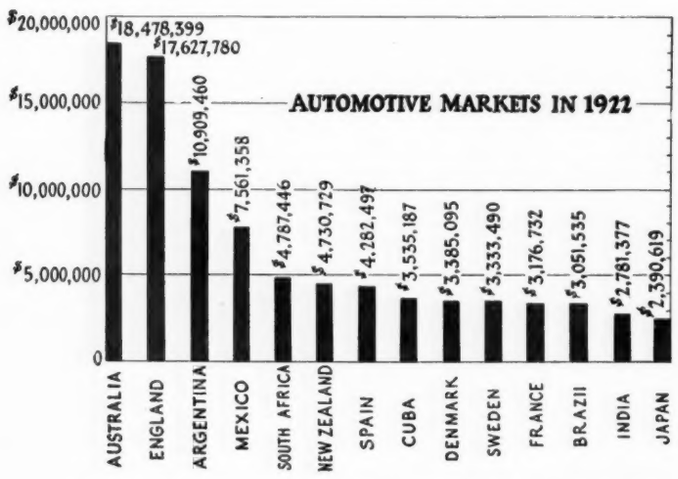

Fig. 1—This comparative table of 1922 exports combines the total value of cars, trucks, tires and parts from the United States, and the cars, trucks, and parts from Canada during the calendar year 1922

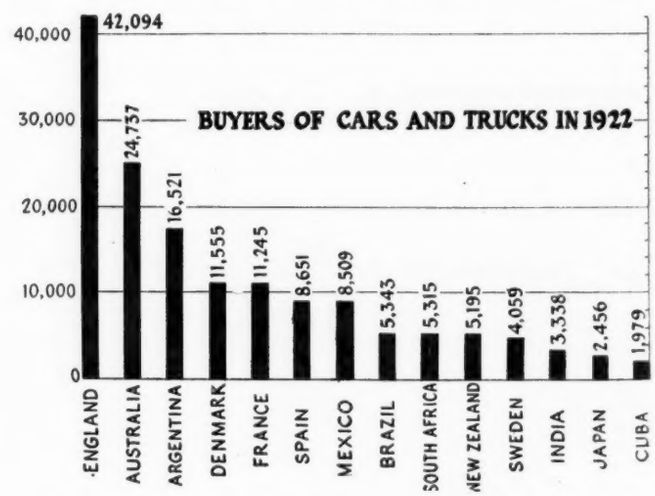

Fig. 2—Table showing shipments in 1922 of cars and trucks from both the United States and Canada and the assemblies of Ford cars and trucks in the six branches located in England, Argentina, Denmark, France, Spain and Brazil

lighting plants, the total amassed for 1922 becomes $136,557,354.

The value of all manufactured goods shipped from the United States last year, according to a recent governmental announcement, was approximately $1,292,000,000. The industry thus has the distinction of having contributed considerably more than 10 per cent of the total foreign trade in manufactured products. It is doubtful if any other one industry has contributed so large a share.

Even with this total the automotive picture has not been completed. To the more than $136,000,000 worth of automotive products might be added the gasoline exports from the United States, practically all of which were required for the operation of motor vehicles. These shipments for 1922 were 579,062,006 gallons, valued at $126,826,842. The sum of these two items is $263,384,926. A further addition of lubricating oils might be made, but it is impossible to separate this item (which had a total in 1922 of $76,642,420) into the percentage used by the automotive industry and that used for other purposes. Consideration also should be given the value of the Canadian shipments of cars, trucks and parts, which in 1922 reached $24,080,530, having jumped from $6,728,432 for the previous year.

Comparison of the 1922 and 1921 shipments from the United States and Canada is impressive. Passenger cars jumped from 30,950 in 1921 to 66,790 for the United States and from 9821 to 35,394 for Canada. Much of this Canadian gain is due to the diversion of General Motors business to the Oshawa plant late in 1921 but the fact remains that the combined shipments of passenger cars from these two countries rose from 40,771 in 1921 to 102,184 last year, the gain being approximately 155 per cent. Motor trucks from the United States were 11,445 in 1922 as compared with 7480 and from Canada 2564 as compared with 1349. Practically every item recorded a gain.

Shipments from the United States*

	1922	1921
Passenger cars	66,790	30,950
	$51,049,616	$32,533,725
Motor trucks	11,445	7,480
	$8,270,908	$10,335,893
Parts	$38,298,032	$39,058,720
Automobile engines	$5,132,754	$1,821,120
Gas engines	5,818	1,320
	$709,877	$362,570
Tires	$19,898,412	$16,466,155
Motorcycles	11,001	15,976
	$4,028,742	$3,517,769
Airplanes and airplane parts	$422,511	$466,548
Farm tractors	9,959	2,380
	$5,960,459	$2,247,001
Storage batteries	110,955	(Nine months only)
	$1,472,692	.....
Magnetos, spark plugs, etc.	$838,782	.....
Isolated lighting plants	1,471	
	$441,569	.....
Gasoline	579,062,006 gal.	533,075,335 gal.
	$126,826,842	$130,906,416

*Porto Rico, Hawaii and Alaska not included.—In ten months of 1922, Alaska purchased 110 cars and 68 trucks, Hawaii 1792 cars and 185 trucks and Porto Rico 531 cars and 100 trucks.

Shipments from Canada

	1922	1921
Passenger cars	35,394	9,821
	$21,059,874	$4,873,792
Motor trucks	2,564	1,349
	$1,094,539	$669,472
Parts	$1,926,117	$1,185,168

The world motor vehicle census, as published elsewhere in this issue, shows a total of 2,379,091 automobiles in operation in all countries outside of the United States, a gain of 295,801 for the year. This increase of 14.12 per cent is practically the same as was recorded for 1922 in the United States, where it was approximately 17 per cent.

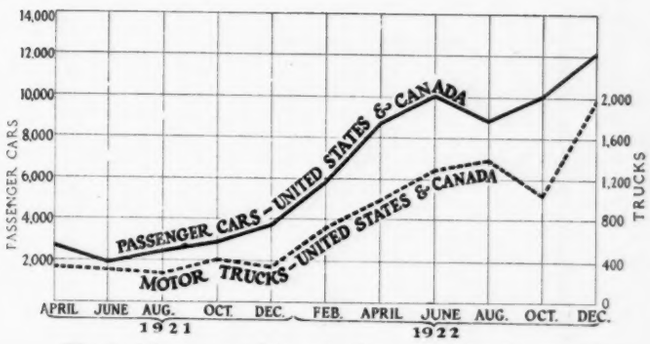

Fig. 3. The upward trend of car and truck exports.

The year was one of steadily enlarging export markets. January was the smallest month and December the largest. At the beginning of 1922 the world was still in the midst of its financial depression and in many territories there were still unsold many hundreds of cars and trucks left over from the overshipments of late 1920 and early 1921. In January, 1922, the overseas sales from both the United States and Canada were only 3751 cars and 562 motor trucks. December sales were 12,215 cars and 1987 trucks.

Business conditions abroad, however, had changed materially. Exchange had moved more satisfactorily for many territories, the commercial outlook had broadened and buying power had been restored to a considerable degree. The abnormal stocks of cars, accessories and other products were liquidated in practically every locality and, given an added impetus by the lower prices resulting from factory reductions and the betterment in exchange, new buying was a natural result.

Nearly every territory was affected, this being true alike for passenger cars, parts, tires and much other equipment. It was true also to a certain extent in the truck field, but this section of the industry has not expanded at anything like the rate of passenger cars. Stocks of old models have not been everywhere sold out, particularly of the heavier sizes. On the other hand, there has been an impressive development throughout the last year or more in the establishment of motor bus service in many territories and likewise in the use of the lighter sizes of trucks for delivery work.

The truck markets, to sum up what undoubtedly is the universal experience of exporters, are slowly enlarging, particularly for the smaller sizes, but much merchandising effort yet remains to be made before the motor truck is accepted generally in the foreign territories as the efficient and economical vehicle of transportation that the United States knows it to be.

Classified Data Available

In 1922, for the first time, export shipments from the United States have been classified for both cars and trucks. This applies only to shipments from the United States and, consequently, does not mean as much as it would if similar statistics from Canada and more detailed figures as to the Ford foreign construction were available. For passenger cars, this classification for the United States shows 42,227, valued at $20,503,025, with a unit value up to $800; 22,513, valued at $24,610,341, with a unit value from $800 to $2,000, and an additional 2027, valued at $5,925,969, with a unit value of over $2,000. On the face of it, this comparison seems to show a high percentage of the medium priced class, much higher than is customary in the domestic markets, but the factors previously mentioned throw such a deduction entirely out of balance, the fact being that most of the overseas markets are now

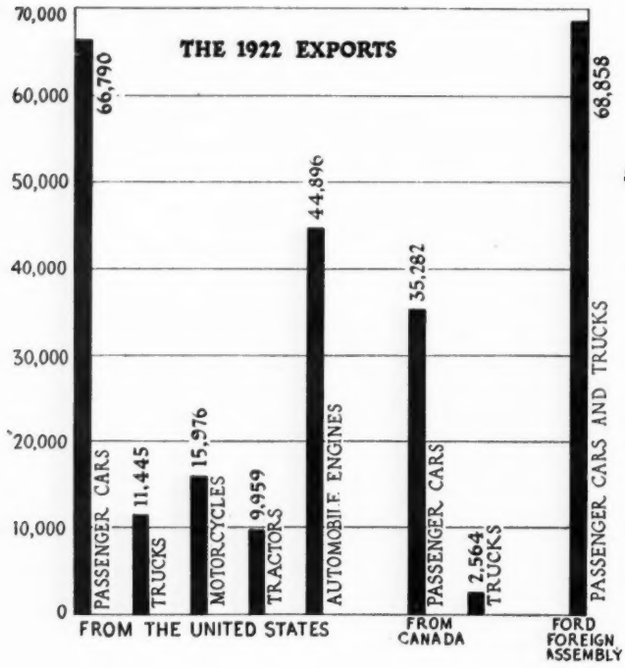

Fig. 4. Comparative table showing 1922 international trade in American cars, trucks, motorcycles, tractors, and automobile engines by number.

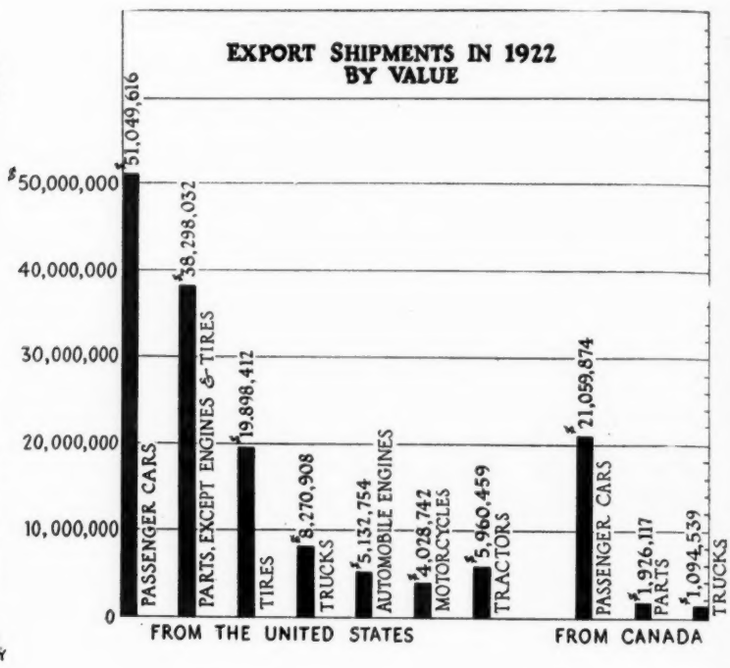

Fig. 5. Value of export shipments made in 1922.

taking automobiles in about the same ratio of price classes that is customary in this country. The classifications given for motor trucks are 8142, valued at $3,142,897, of one ton or under; 2588, valued at $3,198,260, over one ton and up to two and one-half tons, and 725, valued at $1,938,576, of the larger sizes.

The tables published elsewhere in this issue give in detail the 1922 shipments, not only from the United States, but from Canada and the chief European countries.

These tables, however, do not give combined totals and they do not show the Ford foreign production. According to a revision of the previously announced Ford figures, production in the various plants for 1922 was as follows: Manchester, England, 27,194; Buenos Aires, 11,871; Copenhagen, Denmark, 10,552; Bordeaux, France, 10,548; Cadiz, Spain, 5331, and Sao Paulo, Brazil, 3362. This gives a total foreign production of 68,858. The Canadian plant, as a matter of interest, is credited during the year with 50,266. Ford's foreign sales, excluding those shipped from Canada, have just been announced as totalling 87,015 in 1922.

Canada is not, of course, figured as an export territory, although there are a few companies, notably Dodge, which control their sales in the Dominion through the foreign department. Since it is not general practice to consider Canada as export territory, no consideration has been given to its requirements in this statistical study. Shipments to Canada, however, are included in the official statement for exports from the United States and these are included in the total of 66,790 passenger cars and 11,445 motor trucks sent abroad from this country last year. These Canadian shipments from this country were 10,212 passenger cars and 1260 motor trucks.

The chief markets, based on the American and Canadian car and truck shipments and the Ford foreign assemblies, are as follows, with the total taken by each during the year: England 42,094, Australia 24,737, Argentina 16,521, Denmark 11,555, France 11,245, Spain 8651, Mexico 8509, Brazil 5343, South Africa 5315, New Zealand 5195, Sweden 4059, India 3338, Japan 2456 and Cuba 1979.

Leaving out the Ford assemblies and considering only the shipments of passenger cars from the United States and Canada, the chief markets were: Australia 22,094, England 14,072, Mexico 7426, South Africa 4976, New Zealand 4688, Argentina 4602, Sweden 3672, India 3077, Spain 2534, Brazil 1916, Japan 1455 and Cuba 1689. This tabulation, however, is not an important one, as it contains the Ford totals for some countries and leaves them out in others. Similarly, in the truck field, Australia was the leader with 2643, Japan following with 1001 and Mexico being third with 983. Spain was fourth with 786, following which came England, New Zealand, Sweden, South Africa, Cuba and India. This tabulation has the same drawback as the previous one referring to passenger cars.

In the shipments of parts from both the United States and Canada, the influence of the Ford assemblies is shown more conclusively, as in these totals is contained much of the material going from this country to be fabricated into Ford vehicles overseas. The comparison here shows England to have been in the lead with a value of $4,155,437, Argentina being second with $3,347,673. The third country was France, with shipments valued at $2,141,907, followed by Denmark with $2,021,712, Australia $1,631,752, Spain $1,344,235, Mexico $905,020, Brazil $760,875, Cuba $724,137, South Africa $541,488, India $515,740, New Zealand $420,729 and Sweden $207,826.

In seeking to determine the comparative value of the various export markets, a combination of all of these items probably will give the clearest picture and will determine definitely just what territories were of the most importance last year to the export section of the industry. Such a table would bring together the value of all automotive shipments, from both the United States and Canada. A tabulation of this character, the totals consisting of the car, truck, parts and tire shipments from the United States and the car, truck and parts shipments from Canada, shows Australia to have been well in the lead, with total purchases of $18,478,399. England was second, with Argentina and Mexico coming third and fourth, the respective totals being $17,727,780, $10,909,460 and $7,561,358. Following them were South Africa $4,787,446, New Zealand $4,730,729, Spain $4,282,497, Cuba $3,535,187, Denmark $3,385,095, Sweden $3,333,490, France $3,176,732, Brazil $3,051,535 and India $2,781,377.

1923 Statistical Issue

THIS issue is designed as a statistical picture of the automotive industry as it is today. Wherever possible, the present has been compared with the past and some indication has been given of future probabilities. Every effort has been made to have the data accurate and complete. Improvements have been made over last year in the way of presentation, in an attempt to render the issue more easily used as a reference volume.

Several new features have been added, such as motor bus, taxicab, rail car and stock clutch specifications. We will welcome comments on these items, favorable or otherwise, with a view to incorporating constructive suggestions in future issues of a similar character.

If errors have crept into any of these data, they have come despite every care in checking and compiling. We want to know about any that are discovered, that we may correct them.

Hoover Seeks Rubber Survey

SUBSTANTIAL evidence of the Administration's deep interest in the crude rubber situation is found in reports from Washington. President Harding has urged that a survey be authorized to determine the feasability of establishing rubber plantations in the insular possessions. Secretary of Commerce Hoover has asked Congress for an appropriation of $400,000 to investigate the possibilities in the Philippines and South America with an additional $100,000 to defray the cost of experiments by the Department of Agriculture.

A plentiful supply of crude rubber at a reasonable price is absolutely essential for the United States. Whether or not British producers will assume a more reasonable attitude as the result of the visit of their commission to this country remains to be seen, but whatever position they take, it is unthinkable that Americans always will continue to rely upon foreigners for a commodity of such vital necessity.

The administration's interest may be due in part to the more immediate needs of the rubber industry, but it probably is due chiefly to more remote considerations. The peace of the world promises to be more or less unstable for some time to come and in the event of another great war it would not be pleasant to be dependent upon foreigners for rubber. Motor transport probably will play in future wars an even larger part than it did in the last and it would be difficult to exaggerate the importance of a continued flow of rubber for tires as well as other military needs.

Automobiles and Whooping Cough

STATISTICS compiled by *The American Motorist* show that whooping cough cost 10,968 lives in 1920 and that motor vehicles killed only 10,168 in 1921. It is contended also that automobile fatalities are not increasing in proportion to the gain in registrations. In fact the number of deaths caused by motor vehicles per 10,000 cars has been almost cut in half since 1915.

There is cold comfort in these figures for the relatives of persons killed either by whooping cough or motor cars. Death from disease is less horrible than death by violence but the result is the same. There are too many fatalities from both causes.

Medical science has made astounding strides in the past few years in lowering the death rate from preventable diseases but its work in this direction has only begun. More stringent traffic regulations may have lowered the percentage of automobile fatalities in proportion to the number of vehicles, or pedestrians may have become better dodgers, but the fact remains that there are altogether too many accidents.

The only way to cut down the ghastly toll taken by motor cars is to study scientifically means of prevention. The problem can't be solved by rule of thumb methods or by legislative enactments. A lowered death rate from tuberculosis, for example, has been the result of a long continued, patient campaign of education.

If equal attention were paid to the promotion of safety the results might be equally gratifying. Efforts in this direction in the past have been too sporadic. In this work the motorist can play an important part. No study of statistics is of any value unless it leads to something. "Jay-walking" may be a favorite means of committing suicide but pointing out that fact does not lessen animosity toward the automobile.

Annoying Delays in Tank Filling

CERTAIN manufacturers of gasoline and oil-filling station apparatus have recently directed our attention to the fire hazard and delay at gasoline filling stations which is occasioned by the use of gasoline tank filler pipes which are either so small or so crooked as to occasion considerable loss of time in filling the tank and which not infrequently result in spilling considerable quantities of gasoline, with consequent waste of fuel.

This is a matter which causes criticism by the car user as well as by the service station operator and therefore helps to build up future sales resistance. The delays which are occasioned by crooked or too small filling spouts affect not only the users of the car involved, but often the users of many other cars who are waiting in line at the filler station.

A crooked pipe or one in which the gasoline gage mechanism interferes with free entrance of the fuel often causes air to be trapped in the fuel tank. This air must bubble back past the fuel and oftentimes pass through it, not infrequently causing an overflow which would not occur in the case of a straight pipe of adequate diameter. In most cases it would appear to be possible to use a straight pipe instead of a gooseneck or other crooked form and the straight pipe would be less expensive.

When a crooked pipe is necessary, however, or is the least objectionable compromise, it is an easy matter to provide a separate air vent which would eliminate the trouble to which a crooked pipe is subject. S. A. E. recommended practice specifies filler openings which have a minimum diameter of 2 in. This is ample to permit the insertion of the largest size gasoline pump nozzle and to provide the necessary air vent providing straight filler pipe is employed. There seems to be no good reason why this standard should not be generally applied in practice.

Gasoline pump manufacturers state that there are many cars in use today, especially those with filling pipes projecting through the dash, into which it is impossible to pour gasoline at a rate of more than 2 or 3 gal. per minute, whereas modern gasoline pumps are often capable of delivering 15 to 18 gal. per minute.

A somewhat similar situation exists in respect to filler openings and pipes for crankcase oil. Some of these are made so small as to preclude the use of any but very small funnels so that the filling operation is a slow one at best and often results in spilling considerable quantities of oil. Just why some designers have chosen to use an oil fill opening not much over ¾ in. in diameter is not clear. It is certainly feasible to have a clear opening of at least 1¼ in. in diameter. One which is not obstructed by baffle or strainer within 3 or 4 in. from the opening is preferable.

At first thought these criticisms may seem to be of minor importance as compared to others which are of much greater significance. It must be evident, however, that failure to heed just criticism, even though it be of a minor character, ultimately results in considerable loss of prestige and in sales resistance which is not easy to overcome. This is especially true in the case of small items which cause direct annoyance to the user who, in the last analysis, is the individual whom the designer must seek to please.

Ford and Muscle Shoals

THE past few weeks have brought about in Congress a recrudescence of interest in Henry Ford's offer for Muscle Shoals. If it could be brought to a vote in the House at this session friends of the Ford plan probably would win, although the reverse might be true in the Senate, but there is no possibility of action before adjournment with the ship subsidy bill in the offing. This means that nothing definite will be done before the new Congress meets in December.

Ford's chances undoubtedly will be much better at the next session and he probably will be content to wait. He is making no particular effort to force action. He knows that the atmosphere in the new Congress will be more progressive, not to say radical. The only people in the South who are opposed to his offer are the water power interests, but the powerful agricultural groups, with visions of cheaper fertilizer for the farmer, will back him.

Unless an impending presidential campaign brings complications, the chances seem to be that another eighteen months will see Ford in control of the great power reservoir in the Tennessee river. With it in his hands, his plans will unfold rapidly and the country soon will see the opening acts of a stupendous industrial drama.

Light on Closed Car Values

THIS year will see an increased production of closed cars. A 5 per cent increase will make the value of the closed car output exceed that of open cars, assuming that prices remain comparatively stationary.

Efforts to reduce the cost of closed car bodies have been evidence of a realization of the growing importance of this type of car. The fact this type furnished 43 per cent of the retail value of last year's output brings home the importance of the closed car to the industry as a whole from the standpoint of value.

An analysis of the closed car business from a production standpoint tells less than half the story. The whole tale puts the closed car in even better light.

Each Show Bringing More Encouragement

Southeast and Pacific Coast Report Interest—Production on High Level

NEW YORK, Feb. 19—Operations at major automobile producing plants are proceeding on schedules that promise a close approach in total output to the record established in January, despite the fact that February is a short month and includes a holiday. The cold snap of last week resulted in the tying-up of rail facilities at the principal manufacturing centers and the consequent retarding of shipments to and from factories. This permitted manufacturers to build up a reserve of finished products, which, however, will go forward as soon as rail equipment can move, but it did not necessitate a curtailment of operations.

Demand for automobiles continues insistent in practically all sections of the country with only a slight showing of stocking of cars by dealers. Manufacturers, basing their activities on actual conditions in the field, find further encouragement to maintain production on more than normal programs in the reports of shows held during the week.

Southeast Promises Expansion

Interest evidenced in Atlanta reflected the general improvement in industrial conditions in that region and gave further promise of expansion of trade for the automotive industry through the Southeast. The exhibit in Portland, Ore., developed an unexpected demand in that section of the Pacific Coast and, among cities lying midway of these centers, Toledo furnished proof of the forward trend at chief distributing points of the Middle West.

Many of the orders received have been for spring delivery, but there is a strong current demand that will dispose of factory output immediately upon delivery.

Tractor business in the Southeast has shown steady improvement, with January reported to be the best month in volume of sales of any in the last three years. This is owing to the greater buying power among the farmers. Expansion in this branch of the industry is expected this spring in the Northwest, where there have been indications of a marked reawakening.

This revived spirit of buying in agricultural sections will have its bearing on truck sales and improvement is already noted through Minnesota and the Dakotas. Industrial centers continue to take a major part of the output at present and factory operations still give much attention to bus and rail car production.

Parts business is mounting to new high levels due to the pressure of demand from automobile producers. Increasing releases of parts are due in a measure to the expectancy of retarded rail movements in the spring and the desire of car builders to be able to proceed with manufacturing on a high level.

Business in Brief

NEW YORK, Feb. 21—Further evidence of great gain in business activity were noted last week. Improvement in some lines was retarded by the storms which have swept over the entire country, retail trade in particular suffering. Other lines, especially rubber footwear, benefited.

Unfilled steel orders reflected the forward movement of industry. Prices of iron and steel from the crude to the highly finished products showed a general advance. Unfilled orders for locomotives was another factor of importance.

Movement of farm products was delayed by storms, and undoubtedly the falling off in car loadings was due in a large measure to the same cause.

The month of January set up a new high mark for building construction which has been continued in February, except in localities where the weather prevented. Building activity has stimulated industries contributing raw materials and finished products such as brick and cement.

Another indication of maintained industrial progress is seen in the scarcity of labor. The problem is no longer one of furnishing employment, but rather one of getting sufficient help to increase output and fill existing demands.

Class 1 railroads showed a decided gain in operating income for the month of December when compared with the same month in 1921.

Greater activity in the stock market last week reflected the feeling of optimism over domestic industry in spite of the unfavorable news from Europe. Daily sales exceeding 1,000,000 marked this activity. Bonds remained firm and active.

M. A. M. A. Has New Export Committee

S. W. Dorman Heads It — Will Formulate Policy for International Trade

NEW YORK, Feb. 20—An active policy in regard to the development of international trade for the members of the Motor and Accessory Manufacturers Association will be formulated by the new foreign trade committee of the association, the formation of which was announced here today.

The committee is headed by S. W. Dorman, vice-president and general manager of the Overseas Motor Service Corp. of this city. The other members are J. F. Kelly, export manager of the Electric Storage Battery Co.; E. P. Chalfant of the Gill Manufacturing Co. and M. Lincoln Schuster of the association.

The new committee, which is taking over the work of the former foreign trade committee that was headed by W. O. Rutherford, the president of the association, held its first meeting today, making a preliminary survey of the field and determining upon the initial steps in the evolution of a program having for its aim the inclusion of all members of the association making products applicable to international trade.

Bulletin Service Proves Interest

Through the bulletin service that the association has developed during the last twelve months, it has been found that more than one-fourth of the members are interested, in one form or another, in foreign trading effort. The new committee will seek to work closely in a trade way with these companies, and it will seek to build within the entire membership of the association an understanding of the possibilities of the foreign field.

Further meetings will be held shortly and the work of the committee further developed. The following statement, prepared by the committee, sets forth the present outlook and indicates the need for such work as is planned:

The demand for automotive products and equipment of nearly every class is in many parts of the world materially increasing and the orders being received by numerous American manufacturers are now at a volume considerably larger than at any time during the last two years. Expansion in automobile operation is continuing in most countries, this generally being true with the exception of some sections of Western, Central and Eastern Europe, which, of course, are closed because of financial or political conditions.

Otherwise, in Australia, New Zealand, much of the Far East, including the Philippine Islands and Hawaii, Latin-America,

(*Continued on page* 491)

Standard Parts Sale Is Set for March 29

Stockholders Made Attempt to Raise Sufficient Funds to Buy Eleven Plants

CLEVELAND, Feb. 20 — Eleven plants of the Standard Parts Co., each of which is equipped for manufacturing parts and accessories, will be sold to the highest bidder on March 29 in the United States District Court in this city. The order for the sale has been issued by Federal Judge D. C. Westenhaver, who appointed receivers for the company in September, 1920.

The eleven plants are all in operation, are working on contracts and have orders to keep them busy for some time. The plants are worth more than $1,000,000, and are the remaining ones of the $20,000,000 corporation built by Christian Girl, who left the company in 1920. They will be sold subject to existing contracts and there will be no interference with work now going on. Orders will be filled promptly and the receiver will carry the plants along until the sale.

Stockholders' Investment $20,000,000

The issuance of the order here followed the unsuccessful attempt of stockholders to save their investment by raising sufficient capital to purchase the plants. Judge Westenhaver, before making the order, stated he hoped a way would be found to preserve the property for the benefit of creditors and stockholders. Stockholders fear the sale will wipe out their $20,000,000 investment, represented by $6,439,000 in preferred and $14,262,331 in common stock.

When Receiver Frank Scott filed his application for the sale last December, claims against the company were placed at $9,754,003, of which $6,816,917 was due creditors before the appointment of receivers. Until Nov. 30, 1922, the business under the receivers had incurred additional obligations totaling $625,000. At a meeting of creditors on Dec. 7 it was decided to ask the court to sell the properties. In 1922 the company had distributed $7,500,000 worth of automotive materials.

Plants to Be Sold

The following assets are to be sold:

Eaton Axle plant, together with a fifteen acre tract at Darley Avenue, N. E., and New York Central tracks, six lots in another parcel and all machinery and equipment of plant.

Standard Welding plants and machinery, tools and good will and eight parcels of land on and near Darlington Avenue, N. W., from West Seventy-fourth to Seventy-sixth Streets.

Perfection Spring plants and nine parcels, two leased for ninety-nine years, on Central Avenue, S. E., between East Sixty-fifth and East Sixty-ninth Streets.

Pontiac Spring plant and four parcels of land at Pontiac, Mich.

Cleveland service station at 6515 Carnegie Avenue, S. E., and all machinery.

New York service station and two parcels of land.

One hundred shares of the Standard Parts Co. of Delaware, which operates service station in Boston, Mass.

Bock Bearing Co., 11,695 shares of common stock of this Toledo concern, owned by Standard Parts Co., West Seventieth Street plant at West Seventieth and New York Central Railroad. Plant is of brick and stands on land leased for ninety-nine years.

American Axle plant, Lake Avenue, N. W., and New York Central, together with machinery and three parcels of land.

Hess Spring & Axle plant at Cincinnati and six parcels of land there.

Canton Spring plant in Canton, Ohio, building, machinery and land.

Patents and trade marks, inclusive of all the patents assigned to the Standard Parts Co., of which there are more than 100.

Factory Sales Officials Should Give Dealers Help in Studying Conditions in the Retail Field

By D. J. WILLOUGHBY

Sales Manager of the Columbia Motor Car Co.

Detroit, Feb. 21.

WITH a year of big business in the automobile industry opening before us, it becomes the duty of factory sales officials to study the retail market so that they may help their dealers to get all the business their territories can be made to yield.

Columbia has just completed an analysis of the retail sales market from which it has worked out a text book on business getting, which it will expect its dealers to follow in order that they may reach logical buyers in their price class. Dealers who are enabled to reach quickly the persons who are in position to buy in their price class are working efficiently.

Too little attention has been given the dealer by the factory and he has been left almost exclusively to develop his business as best he could. This was all right in the days when everyone wanted automobiles and nobody had any. A large part of the dealers have never had the business training necessary to meet present-day conditions and the factory must help them.

The financial situation is improved to such a degree that there is little difficulty experienced by dealers in getting all the credit accommodations they need from banks. In the Eastern cities, banks are financing dealers up to 90 per cent of the cost of the car at rates of about 6 per cent. This is largely the condition east of the Mississippi. West of the Mississippi the situation is not so good, but it is vastly improved and with the farm market opening the banks are sure to extend their facilities.

There is no question about the farm demand. Business is opening up throughout the entire country and dealers are hastening back into the field. From one farm district alone, in which there has been no representation for several years, we have had seven applicants for sales rights and similar conditions obtain in many other sections.

There is just one section that has failed to respond to the improvement noted generally throughout the country, and that is the Northwest territory taking in Montana and the Dakotas. In the East, dealers are bending every effort to get cars but are forced to wait because of the poor railroad conditions.

Closed car business is giving place to open cars now that the winter has about passed. Although there is a constantly enlarging closed-car market, the open car will continue to dominate in total sales, principally because of lower prices.

New Issue Is Offered of Motor Wheel Bonds

NEW YORK, Feb. 19—The National City Co. is offering a new issue of $2,000,000 ten year sinking fund 6 per cent gold bonds of the Motor Wheel Corp., dated March 1, 1923, and due March 1, 1933, at a price of 96 and accrued interest to yield about 6.55 per cent. The bonds are redeemable as a whole or in part at 103 if redeemed on or before March 1, 1926; at 102 thereafter, if on or before March 1, 1929; and thereafter at 101.

The bonds will constitute the only funded debt of the corporation, with the exception of certain purchase money obligations, incurred in connection with recent acquisitions, which are expected to be paid off in the near future. The trust agreement will provide for a fixed semi-annual minimum sinking fund sufficient to retire $100,000 principal amount of these bonds in each year, beginning Jan. 15, 1924.

As an additional sinking fund the corporation is to pay semi-annually out of surplus earnings a further sum sufficient to retire an additional $100,000 principal amount of bonds in each year.

Durant Announces Buying Glass Plant

Capacity of Kane, Pa., Factory Is Between 5,000,000 and 6,000,000 Sq. Ft. Yearly

NEW YORK, Feb. 19—Declaring that the production of automobiles this year will be regulated by the ability of glass manufacturers to produce plate glass in sufficient quantities to meet the requirements of motor car manufacturers, W. C. Durant today announced that on Dec. 20, 1922, he had purchased the entire stock of the American Plate Glass Co., located at Kane, Pa.

"Its buildings, furnaces and equipment are in excellent condition and its capacity is between 5,000,000 and 6,000,000 sq. ft. of plate glass a year—sufficient to meet all the requirements of Durant enterprises for some time to come," says the announcement. "Its relationship with Durant automobile body builders will be similar to that existing between the National Plate Glass Co. and the Fisher Body Corp., which the latter owns and controls. The American Plate Glass Co. will be independently financed."

According to statisticians, three concerns—Fisher Body Corp., Ford Motor Co. and Durant Motors—control one-third of the country's total plate glass production. It is estimated that this production is about 120,000,000 sq. ft. a year, of which Fisher controls between 25,000,000 and 30,000,000, Ford in the neighborhood of 7,000,000 and Durant about 6,000,000.

Surplus Increased $20,000,000

It is also stated that Durant Motors, Inc., surplus for the year ending Dec. 31, 1922, has been increased over $20,000,000, and that the book value of the stock as of that date was approximately $53 a share.

The company reports that the financial statement of the Durant Motor Co. of Michigan shows that the invested capital of Dec. 31, 1922, was $1,400,310, and that the net profits for the year 1922 were $1,437,749. These net profits are exclusive of $237,495 set aside for Federal income, State and local taxes, and $71,754 written off to set up as a reserve for depreciation of buildings, etc. This, it is stated, is equivalent to more than 100 per cent on the investment, 60 per cent of which goes to Durant Motors, Inc., and 40 per cent to the stockholders. This stock now is quoted at $30 a share.

Ford Gets 6,000,000 More Feet

DETROIT, Feb. 17.—Purchase by the Ford Motor Co. of the Allegheny Plate Glass Co. plant at Glassmere, Pa., will give 6,000,000 sq. ft. of plate glass a year for use in manufacture of its closed bodies and windshields. The company's requirements are for more than 10,000,000 feet of glass yearly, so that there will be no surplus for sale to supply sources as in the case of other materials manufactured or mined by the company.

Following the purchase, Ford increased the wages of the employees 80 per cent, common laborers being paid 62½ cents an hour at the start. Laborers hired at this wage will be employed on sixty days' probation and if their work proves satisfactory will receive 75 cents at the end of this period. The standard working day at the plant will be eight hours. No person under 20 years old will be employed.

The plans of the company for the manufacture of glass at its River Rouge industrial city will proceed without change as it is declared that the entire product of both plants will be needed to meet requirements.

The main reason for the acquisition of the glass plant is found in the demand for closed bodies, which is running higher than at any time. Estimates on closed business this year have been placed at 30 to 40 per cent. Extent of the closed car business is holding production to somewhat lower figures than normally, and considerably below the sales mark. February will fall about 25,000 short of demand from dealers.

With the completion of its new body assembly plants in Chicago, Los Angeles and other points the company will be in position to meet all needs, and the plate glass purchase now completed makes this material supply source secure.

Henry M. Leland Reaches His Eightieth Birthday

DETROIT, Feb. 17.—Henry M. Leland, former president of the Cadillac Motor Car Co. and founder of the Lincoln Motor Car Co., from which he is now retired, celebrated his eightieth birthday yesterday. As a proof of his remarkable vigor at that age Mr. Leland walked downstairs from his office on the twenty-second floor of the Dime Bank Building to the ground floor and then walked back up again.

The veteran car manufacturer was the recipient of many messages of congratulation, and received also a basket of eighty roses representing a group of eighty friends with the name of each attached to each bloom. Among these was one from H. H. Rice, president of Cadillac, which read: "Heartiest congratulations. Best wishes for many more years of useful service, the example of which has been an inspiration to so many."

BODY COMPANIES MERGE

DETROIT, Feb. 17—The S. & S. Body Co., Detroit, and the National Body Co. of Bay City have been merged under the name National Body Co., and will manufacture commercial bodies in Bay City.

The company is capitalized at $100,000 and has purchased a plant from the International Mill & Timber Co. Salesrooms will be maintained in Detroit and other truck centers.

Ryan-Bohn Foundry Wishes to Dissolve

In Applying to Court, Company Says It Cannot Continue Without Refinancing

DETROIT, Feb. 21—Ryan-Bohn Foundry Co., Lansing, specializing in the manufacture and machining of cast parts, has filed papers in the Circuit Court asking authority for dissolution. Application was also made to the court for the appointment of a receiver to operate the company as a going concern until final disposition of the dissolution proceedings is made. It is declared in the application that the company cannot continue without refinancing.

In its statement it says that it has big contracts with three important companies and that it would be possible to operate the plant at a profit if it were unharassed and working capital were available. Operating of the company has been rendered impossible, according to the petition, by threatened suits as a result of inability to fill contracts which were bid in at prices now below cost.

Another contributing factor to operation at loss in the past few months is declared to be a contract for the purchase of iron at $40.50 a ton, which is in excess of prevailing market prices, and on which there are still 1986 tons to be delivered. Enforcement of the delivery makes for production costs in excess of its contract prices, the company said.

The officers of the company are Edward VerLinden, president and treasurer; D. J. Ryan, vice-president, and E. C. Shields, secretary. The company was organized in January, 1920, with an authorized capitalization of $2,000,000. Liabilities independent of stock total $685,823. Current assets are $2,000 in cash and about $50,000 in accounts receivable.

Monsen Heads Company to Manufacture Revere

LOGANSPORT, IND., Feb. 19—A new Revere Motor Co. has been incorporated in Indiana to manufacture the Revere car and the Monsen engine, and has purchased from the receiver the assets of the old Revere Motor Car Co. Capitalization of the new company is $250,000.

In announcing the formation of the company, Adolph Monsen, vice-president and general manager, said that the company would not undertake to get into large production, but would confine its efforts to producing a high grade car in limited quantities. Other officers of the company are: President, Charles E. Barnes; treasurer, Henry A. Kraut, and secretary, Fred J. Steffens.

Bessemer-American Merger Sanctioned

Stockholders Take Favorable Action—Proctor W. Hansl Becomes President

PHILADELPHIA, Feb. 21 — Stockholders have voted favorably on the consolidation of the Bessemer Motor Truck Co. of Philadelphia and the American Motors Corp. of Plainfield, N. J., makers respectively of the Bessemer truck and the American passenger car, and the merger will take effect immediately. The new company will be known as the Bessemer-American Motors Corp., whose securities will be issued to stockholders in exchange for their present holdings, in accordance with a pre-arranged plan.

Arrangements now are being made to consolidate the manufacturing operations of the two properties at one plant, but sales activities will be handled independently of each other as heretofore.

The consolidated company will be headed by Proctor W. Hansl, prominent in the reorganization of American Motors, while Robert Bursner will handle finances and also assume general supervision of the passenger car division.

I. M. Lewis, formerly vice-president of the Hydraulic Pressed Steel Co., will head the truck division and also be responsible for production and general coordination of activities between the two organizations as vice-president and general manager.

E. J. Fithian, treasurer of the Bessemer Gas Engine Co. of Grove City, Pa., will continue to have an active part in the new organization, while E. F. Von Tackey of Titusville, Pa., and William Newcorn of Plainfield, N. J., will represent important interests on the board.

Under single management it is estimated that the operating expense of both organizations will be substantially reduced by a corresponding gain in earnings and as a part of the plan of consolidation the companies will be provided with additional working capital in excess of $200,000, it is said.

Auto Body Earnings Cut by Low Price Contracts

DETROIT, Feb. 17—The Auto Body Co. will show a slight deficit in its annual report for 1922 owing to the acceptance of a number of low price contracts which were made to keep the factory operating, W. V. C. Jackson, vice-president and general manager, stated at the annual meeting this week. These contracts will soon expire, he said, and the company has over a million dollars' worth of business on the books for 1923 on which it expects to realize satisfactory earnings.

Gross business during 1922 approximated $1,600,000 as against $800,000 the year previous. On the basis of present operation this total will be greatly exceeded in 1923, and will be reached on a new basis of prices. The low price contracts were made at a time when all body companies were bidding for business, it was declared. Conditions in the body building field, owing to the increase in demand for closed models, is now reversed.

The company is seeking adjustments in prices on the unfilled contracts now on its books, which will permit it to go ahead with all its work on a safe earning basis. No changes in the board of directors were made, and it is expected that the same officers will continue in control.

Ford Purposes to Build 129,000 Cars This Month

DETROIT, Feb. 18—Ford Motor Co.'s schedule of 129,000 cars in February will mean a production of about 5400 daily in the twenty-four working days that the month affords. The highest daily mark the company has ever made was 5699 in August last year.

Total production in January was 119,513 cars and trucks, by far the largest mid-winter month's mark the company has ever reached. Of this total 8368 cars and trucks were built in the foreign plants, with 5758 built in the Canadian factory. The foreign figures by plants were Buenos Aires, 2441; Copenhagen, 701; Manchester, 3,141; Cadiz, 460; Sao Paulo, 603, and Bordeaux, 1022.

Daily production of Fordson tractors during February will approximate 400. In January the River Rouge plant built 7904 tractors, while a year ago in that month there was little, if any, activity in the tractor plant.

Expansion in Atlanta

ATLANTA, Feb. 20—A program of expansion that will increase the capacity of the Atlanta plant of the Ford Motor Co. has been announced by officials of the company here, and work on the project is already under way.

About 25,000 sq. ft. of floor space are being added to the factory proper, increasing the assembling capacity from 150 cars daily to about 225. This, officials state, has been made necessary by the remarkable increase in business the past half year, the largest in the history of the local plant.

The present year it is planned to turn out 50,000 Ford cars and 5000 tractors at the plant.

French Collect Luxury Tax From Manufacturer

PARIS, Feb. 10 (*by mail*)—The French 10 per cent luxury tax on car sales in future will be collected from the manufacturer instead of from the dealer, and will be abolished on used car sales. It is to be assumed that for imported cars the tax will be collected at the port or after controlling the importer's turnover in the case of an established firm.

Kelly Tire's Gross Profit $12,531,379

Amount Available for Common Stock Dividend Reported to Be $2,526,250

NEW YORK, Feb. 19—The annual report of the Kelly-Springfield Tire Co. shows gross profits of $12,531,379 for 1922 against $6,004,521 in 1921. Net income before dividend payments amounted to $3,144,549 against a deficit of $506,960 in the previous year. These figures are before reserves for Federal taxes.

After allowing for dividends on both the 6 per cent and 8 per cent preferred stocks in 1922, the balance available for the common stock amounted to $2,526,250. This was equal to 27.77 per cent or $6.94 a share earned on the $9,096,002 capital common stock of $25 a share par value outstanding.

The balance sheet at the close of 1922 showed net current assets of $15,588,254 against current liabilities of $1,557,401. The profit and loss surplus amounted to $9,368,556.

Net current assets were divided as follows: Cash, $1,836,462; accounts receivable, $5,708,893; customers' notes receivable, $11,601; notes secured by mortgage, $221,000; other notes receivable, $28,280; preferred stock at cost, $130,925, and inventories valued at $8,018,034.

The income account for 1922 as shown in the annual report, compared with figures for 1921 follows:

	1922	1921
Gross profits	$12,531,379	$6,004,521
Operating expenses	7,305,176	4,567,427
Operating income	5,226,203	1,437,094
Other income	351,643	445,915
Net income, less interest, depreciation, etc.	3,144,549	*506,960
Six per cent preferred dividend	181,113	190,776
Eight per cent preferred dividend	437,186	459,416
Common dividend	.....	322,776
Surplus	2,526,250	479,928

* Deficit

Hoist Creditors Receive Dividend of 22 Per Cent

MILWAUKEE, Feb. 21—Creditors of the Perfection Hoist & Engine Co. of Two Rivers, Wis., formerly of Milwaukee, have received a first dividend of 22 per cent of claims, following the disposition of all of the assets with the exception of patents and trademarks on a mechanical hoist and engine.

The company built and equipped a plant two years ago, but was unable to get into regular production because of the lack of working capital and recently it was decided to liquidate.

A second dividend is expected to be paid out of current proceeds and the return from the sale of the patents. Machine tools and other machinery were disposed of to Milwaukee concerns.

State Control Urged for Transport Lines

Railway Executives at Washington Conference Favor Bus and Truck Regulation

WASHINGTON, Feb. 19—Prominent executives of the American Electric Railway Association at their midyear conference here last week discussed the competition of motor transport and presented their views on the control of the bus as a common carrier.

Among those who spoke were C. D. Emmons, president of the association; Dwight N. Lewis, president of the National Association of Railway and Utility Commissioners; John A. Prescott, president of the Investment Bankers Association and Secretary of the Interior Fall. Each of these speakers referred to motor transport as a transportation force that must be recognized, and the keynote of most of the speeches was the need of State regulation of bus and truck lines.

Quotes President Harding

Emmons endeavored, by inference, to put President Harding in the position of sponsor for motor bus regulation. He quoted a portion of the President's annual message to Congress, "If freight traffic by motor were charged with its proper and proportionate share of highway construction, we should find much of it wasteful and more costly than like service by rail."

According to Emmons, "the President also declared that 'highways should be made to serve as feeders rather than as competitors of the railroads.' This is true. The only possible solution of our transportation problem lies in the proper co-ordination of the electric railways, the steam railroads, the motor truck and the motor bus, with each medium functioning in the field for which it is most economically suited."

Regarding the competition of motor and electric lines, Emmons said in part:

In many communities where the spirit of mutual cooperation exists, electric railways are voluntarily supplementing their service with buses, and the authorities, recognizing the advantage of a single dependable transportation system, are protecting the companies against unfair competition. The public in more communities is doing its part in recognizing that the investor is entitled to a fair return on his investment, and does not object to a rate of fare which will protect the credit of the company.

Recognizes Value of Lines

Lewis told the executives that "the motor car should not be driven out of commission, but should be as strictly held to account as are street railways, and should bear its proper share of the public expenses." As to the restrictive measures dealing with public regulation of motor transport, he said:

No legislation should be enacted that will prevent establishment of needed and desirable motor bus and truck service for the public good, but most assuredly established investment in street railways and interurbans should be safeguarded in the interest of good service to the public, against the piratical and destructive competition that has been so prevalent everywhere.

In this matter, as in all others affecting public utilities, the American people are fair when the situation is thoroughly understood.

The bus and truck usually insist on paralleling, as nearly as possible, the electric interurban railways. To my mind, this is neither fair to the public nor just to the owners of the interurbans.

The cities out our way have had their fling with city passenger buses, and I believe they are through with them, except, maybe as feeders for car lines, which I am glad to note your Association believes in and advocates.

In stating that bus lines are not as prosperous as is generally believed, Lewis said:

From a cursory examination of the financial statements of many bus lines over the United States for 1921, one is struck with the fact that the operating expense is practically the same as the gross revenue; in many cases more. Five bus companies making detailed reports as to operation in 1921, located in California, show a deficit of $42,738 on a capital investment of $1,927,502.

The Iowa Utility Commission, Lewis said, believes that electric carriers should educate the travelling public as to the advantages of their transportation systems.

Secretary of Interior Fall was the honor guest at the banquet. He spoke in favor of regulation, calling attention of the executives to the fact that those

Fitzgerald Production Was Tripled Last Year

TORRINGTON, CONN., Feb. 20—The Fitzgerald Manufacturing Co., manufacturer of cylinder head gaskets, reports that 1922 was one of its most prosperous years, with factories both in this city and in Winsted, Conn., operating at full capacity and both electrical and gasket departments showing marked increases over the previous year.

In the gasket department production was tripled in 1922 and preparation for the current year includes the addition of equipment and facilities to this department capable of turning out 50,000,000 gaskets.

It is stated that this production is assured inasmuch as branch offices have been opened in New York, Chicago, San Francisco, Dallas, Texas, and Toronto, Ont.

OPEN CAR DEMAND INCREASES

DETROIT, Feb. 17—Guy H. Peasley, general sales manager of the Olds Motor Works, declares January and February production this year will compare favorably with peak months in any former year. Olds executives have predicted that production would be moved three months ahead this year as compared to other years. January retail business has been largely in open models mostly for deliveries deferred one and two months.

Bassick Companies to Be Consolidated

Holding Company Formed to Acquire Concerns in Chicago and Bridgeport

CHICAGO, Feb. 20—Announcement has been made here of the formation of the Bassick-Alemite Corp., a holding company, to acquire complete ownership of the Bassick Manufacturing Co. of Chicago and the Bassick Co. of Bridgeport, Conn. The Bassick Manufacturing Co. makes the Alemite lubricating systems for automobiles, and the plants of the Bassick company at Bridgeport, Meriden and Newark produce automotive hardware and a number of accessories, in addition to a general line of hardware.

The new corporation will have 200,000 shares of no par value common stock, a limited amount of which will be offered for public subscription. In addition there will be authorized 5,000,000 shares of 7 per cent preferred stock, par 100, but for the present none of this will be issued.

Working capital is to be provided by an issue of $1,250,000 7 per cent serial notes, which will be offered to the public through the Central Trust Co. of Illinois.

E. W. Bassick will remain at the head of the new corporation as president and will retain his financial interest. It is probable that the general offices of the new corporation will be in Chicago.

It is the purpose of the new corporation to expand and enlarge the business of the company by the addition of products and further introduction of the products now being made.

The Alemite lubrication system is to be pushed in the automotive field and probably introduced in the general machinery field. The Bassick Manufacturing Co. now operates fifty-two service stations where Alemite equipment for automobiles is installed and serviced. This service organization is to be enlarged, according to present plans.

Sales at Brussels Show Exceed Returns in 1921

PARIS, Feb. 10 (*by mail*)—Makers and dealers generally are satisfied with the results of the Brussels Show, declaring that the volume of sales has been greater than in 1921. The number of persons visiting the exhibition during the 13 days it remained open is given as 200,000, with gate receipts 20,000 francs in excess of the last show.

The greatest volume of sales was in low and medium priced cars, but higher class cars were not neglected. In several cases makers announced that prices were only guaranteed until the end of the show, and in consequence this helped to bring in orders. The wild fluctuations in exchange rates, and the unsettled political outlook were not favorable to business, but despite this the demand was brisk.

Syndicate May Bid for Overland Stock

Willys Corp. Receiver Holds Block for Which He Has Been Offered $2,000,000

TOLEDO, Feb. 20—Following the announcement of the bank creditors committee of the Willys Corp. to the preferred stockholders of the Willys-Overland Co., that they wanted the assets of the corporation to be liquidated by April 1, if possible, there has been considerable talk in Toledo of the organization of a big syndicate to bid in the block of common stock of Willys-Overland held by the receivers.

The block represents about a third interest in the local company. It is understood that the receivers have had one bid of about $2,000,000, or at a rate of $2.50 a share, for the entire block, which has been turned down, with market prices about $8 a share. It has been suggested that preferred stockholders take over the common stock held by the corporation receivers.

Willys-Overland now is in the best shape it has been in for many months with production about 700 cars a day and orders coming in faster than production increases.

The identity of the local syndicate is not known, but it is understood the group will be prepared to bid considerably higher than $2,000,000 to keep the control here.

Sale of the common stock of the Bock Bearing Co. by the receiver for the Standard Parts Co., Cleveland, will also probably be taken up by a Toledo syndicate.

Spring Salon Scheduled for New York, May 13-20

NEW YORK, Feb. 20—Exhibitors in the annual Automobile Salon, which is held each winter in New York and Chicago, have decided to hold a spring opening exhibition in New York, and have selected May 13 to 20 as the dates.

The affair will be held in the Hotel Commodore. A change in policy has been made, whereby a limited number of accessories exhibits will be permitted.

Space reservations already have been made by Rolls-Royce, Locomobile, Cunningham, Isotta-Fraschini, Minerva, Duesenberg, Hotchkiss, Benz, Daniels and Leon Rubay, while such custom-built body manufacturers as Fleetwood, Le Baron, Holbrook, Locke and Healey have been booked.

STEEL FOUNDERS EXPANDING

DETROIT, Feb. 19—The Electric Steel Founders' Research Group, composed of the Electric Steel Co. of Chicago, Fort Pitt Steel Casting Co., Lebanon Steel Foundry, Michigan Steel Casting Co. and the Sivyer Steel Casting Co. has decided to expand the scope of its work and to provide for greater activity through its Committee on New Uses for Steel Castings. For this purpose W. J. Corbett has been engaged as industrial engineer, to be associated with R. A. Bull, research director. Corbett's headquarters will be at the group's central office, 639 Diversey Parkway, Chicago.

M. A. M. A. Has Chosen New Export Committee

(*Continued from page* 486)

Great Britain, Spain, South Africa, India and elsewhere, the improved financial condition is going hand in hand with an enlarged volume of automobile business, this naturally resulting in the placing in this country of larger and more frequent orders for all classes of equipment.

A serious service problem is being created in many countries by the greater number of automobiles in operation. This problem is comprehended by numerous American manufacturers, who are taking the proper steps to see that their equipment is being cared for adequately in those other territories. Numerous companies, however, have not realized the importance of this development and are not adequately considering the foreign demand for the products which they manufacture or sell.

We may look for further expansion during the coming months in the foreign demand for practically every class of material manufactured by the members of the Motor and Accessory Manufacturers Association.

G. M. Declares Dividend for Quarter on Common

NEW YORK, Feb. 21—Directors of the General Motors Corp. at their meeting here today declared a dividend upon the no par value common stock of thirty cents a share for the first quarter of 1923, payable March 15 to stockholders of record at the close of business on March 3, 1923.

During 1922 no quarterly dividends were paid on common, but there was a special dividend of fifty cents a share paid on common Dec. 20, 1922. During 1921 the dividend rate was $1 a share per annum, payable twenty-five cents quarterly.

There has been no interruption in the quarterly dividends on the senior securities since they were issued, and the last quarterly payment on these senior issues was paid Feb. 1, 1923. The next payment is due May 1, 1923.

Hoover Would Hurry Figures on Imports

Asks Congress for $150,000—Work of Compilation Is Now Four Months Behind

WASHINGTON, Feb. 21—Secretary of Commerce Hoover has asked Congress for an emergency appropriation of $150,000 for the purpose of compiling import figures under the new tariff act. The fact that it was impossible to gage the volume of imports of automobile products for October until now indicates the condition in the Statistical Division of the department.

The department is practically four months behind in compiling import figures and also is delayed in compiling export figures.

This is due to the new classifications of exports, which was made about one year ago, and to the enlarging of the import classifications since the new tariff law went into effect.

The classifications are more definite in character and much more informative to business interests of the country interested in the specific nature of imports and exports. This has greatly increased the work, however, of the Bureau of Foreign and Domestic Commerce and the Customs staff, which the Department of Commerce recently absorbed, but there was no coincident increases made in the force of employees.

Operations of Last Year Wiped Out India Deficit

AKRON, Feb. 21—The India Tire & Rubber Co. reports that a deficit of $274,487, existing on its books on Dec. 31, 1921, was entirely wiped out by 1922 operations of the company, and that $143 was carried to surplus after paying off the indebtedness. Net earnings of the company on sales of approximately $2,000.000 were $274,630.

The company's statement shows current assets of $574,072, inventories of $416,019; fixed assets of $651,295, and other assets of $27,492, for a total of $1,668.880. Current liabilities were given at $224,203 and accrued items were placed at $13,702.

Table of Imports and Reimports of the Automotive Industry for October, 1922, and Ten Preceding Months

	Oct., 1921		Oct., 1922		Ten Months Ending Oct. 31—1921		1922	
IMPORTS	No.	Value	No.	Value	No.	Value	No.	Value
Automobiles and chassis..	62	$75,074	94	(b)$128,597	461	$773,845	363	(b) $626,196
Other vehicles and parts for them (a).....	..	55,499	...	54,103	...	937,590	...	589,336
REIMPORTS								
Amount of duty collected	..	.....	...	(b) 50,000	...	.....	...	(b) 50,000
Automobiles (free of duty)	130	237,187	262	(b) 403,456	3,312	5,258,944	1,379	(b)2,274,728

(a) Under the new classification by the statistical division of the Department of Commerce, this includes bodies, parts of except tires, aircraft, bicycles and parts except tires, motorcycles and parts except tires, motor boats and parts, railway cars and parts, carriages, drays, trucks and parts.

(b) From Sept. 22 to Oct. 31, under new tariff bill.

Sherman to Return to Class Journal Co.

Will Become Business Counsel, Having Resigned as A. E. A. Merchandising Head

CHICAGO, Feb. 15—The Merchandising Committee of the Automotive Equipment Association yesterday announced that Ray W. Sherman has resigned as merchandising director to again become connected with the Class Journal Co., as business counsel of that company. Sherman resigned the executive editorship of the Class Journal papers almost two years ago for his recent connection with the A. E. A. Merchandising Committee. He now returns to the same company but will be connected with the business department instead of in editorial work. Arthur R. Mogge, recently of the Gibson Co., Indianapolis, will relieve Sherman March 15.

Committee Pays Tribute

The committee's announcement, signed by R. A. Stranahan, chairman, follows:

"We regret to announce that March 15 we are going to lose the services of our merchandising director, Ray W. Sherman, who has so ably conducted the work of the association during the last year and a half.

"An unusual opportunity has been presented to him and we wish to express our appreciation of the excellent services he has rendered and extend our best wishes for his success as business counsel of the Class Journal Co.

"The program of the Merchandising Committee now under way will be continued by the department as now organized and with the assistance of Arthur R. Mogge, formerly with the Gibson Co.

"The Merchandising Committee."

Sherman was with the Class Journal Co. for nine years prior to going into the merchandising work. From the position of a reporter on *Motor World* he had become the editor of that publication and was then advanced to the executive editorship of the company. On his return to the company he will take up development work for the business office.

Would Have Work Continue

"The association's merchandising work," Sherman stated, "should be carried on for a long time to come. The need is still great and the A. E. A. has proved that results can be secured. The 'One Salesman, One Dealer, One Million' campaign now in progress is showing increases of $1,000 and more a month with most of the dealers enlisted in the effort. All that is needed is a continuation of the effort and the automotive equipment industry man can attain a volume that will increase far above the proportionate increase in number of cars sold.

"All the people in the industry, regardless of their product, must realize that the profit of the 'after market,' which comes after the new car is sold, is and can be greater than the profit in new cars themselves. From this market also must come the volume and profit that will build prosperous and substantial dealers, garagemen and repairmen.

"The results secured by the A. E. A. are a tribute to the members of that organization and all their employees and salesmen. It is effort, not money, that brings success in work of this kind. To those who have made the effort has come and will come the reward, and a continuation of the effort cannot fail to bring a return in business volume."

Stockholders Give Assent to Pierce-Arrow Plan

BUFFALO, Feb. 19—Approval of the plan for financing the floating debt of the Pierce-Arrow Motor Car Co. has been given by the stockholders. At the meeting which acted on the proposition, it was reported that the company's current assets now amount to $12,337,274, of which more than $10,000,000 is in inventory account.

The plan which was drawn up for the purpose of paying off the company's bank loans and other floating debts provided for the sale and issue of $3,500,000 one-year 6 per cent secured notes, the creation of an issue of $6,000,000 first mortgage bonds, $4,200,000 8 per cent debentures and 15,750 shares of preference stock and 78,750 shares of additional common stock.

Under the plan none of the $6,000,000 first mortgage bonds were to be sold, but $4,200,000 bearing 7 per cent interest were to be pledged to secure the $3,500,000 of one-year notes. The prior preference stock created will be distributed as a bonus to buyers of the debenture bonds. All of the securities have been underwritten by a syndicate of bankers representing the company. The bank loans which are to be liquidated amount to approximately $7,150,000.

Peerless to Pay Notes Outstanding on May 10

CLEVELAND, Feb. 21—All of the Peerless Truck & Motor Corp.'s 6 per cent secured convertible gold notes which may be outstanding on May 10, next, will be paid off and redeemed by that corporation at face amount, with a premium of 2 per cent and accrued interest.

The notes are not due until Nov. 10, 1925, but the corporation has elected to exercise the right conferred on it by the trust agreement of Nov. 10, 1915, with the Bankers Trust Co. of New York.

Interest will cease from and after May 10, 1923, and coupons maturing after that date will be null and void. Holders will be required to present the notes for payment and redemption on May 10 at the offices of the Bankers Trust Co. in New York.

Foreign Association Headed by Briton

Lanchester Succeeds Marchesi as New President of Bureau Permanent

PARIS, Feb. 10 (*by mail*)—Frank Lanchester, the British delegate, was elected president of the Bureau Permanent, at its Paris meeting this week, in place of M. Marchesi, the Italian delegate, who retired by rotation. The vice-presidency was taken by O. Galopin, the Belgian delegate. Henri Cezanne was re-elected secretary and treasurer of the Bureau.

The Bureau Permanent, which is an association of delegates from all national automobile manufacturers' associations, with the exception of ex-enemy nations, discussed at this meeting the question of national import duties, but did not adopt any resolutions.

The active program mapped out comprised international action with the object of reducing the present high State taxes, which undoubtedly are having a very restrictive influence on automobile development in France, England and Italy. International uniformity in horsepower ratings is being sought.

At present each nation has its own system of determining horsepower, and, as power is generally the basis of taxation, there is every advantage in having a uniform system of calculation. The French formula, which takes into consideration bore, stroke and number of revolutions appears to have the greatest support.

The Bureau is about to study the question of gasoline costs, and the phenomena of variations in gasoline price. All State taxes and import duties eliminated, gasoline costs 50 per cent less in Belgium than in France. Uniformity in railroad rates will be inquired into.

Over certain European routes cost of shipment by rail can be reduced in important proportion by doubling the mileage. The next meeting of the Bureau Permanent, at which America has been invited to be present, will take place in Paris in May.

JOHN J. McNAMARA DEAD

BOSTON, Feb. 19—John J. McNamara, automobile editor of the *Boston Post* for many years and one of the best known men in the advertising field, died here this evening of pneumonia. He caught cold just after returning from the Chicago Automobile Show.

HIGHER GASOLINE PRICE

CHICAGO, Feb. 19—The Standard Oil Co. of Indiana today increased the price of gasoline one cent in the ten middle western States that it serves. This makes the Chicago price 20 cents a gallon from tank wagons and 22 cents a gallon at service stations.

Men of the Industry and What They Are Doing

Rupp Heads Maccar Truck

R. C. H. Rupp has been elected president of the Maccar Truck Co. of Scranton, Pa., succeeding A. B. Warman, who becomes chairman of the board of directors. W. D. Woodworth, formerly of the Packard Motor Car Co. and for years general manager of the Wood Hydraulic Hoist & Body Co., has been chosen vice-president and general manager, while C. A. Weymouth has been appointed director of sales.

G. M. Truck Promotes Hurst

H. L. Hurst, who has been assistant general manager of the General Motors Truck Co., has been elected a vice-president of the company. Hurst has been with the truck company for the past ten years in various capacities, starting as comptroller. Prior to that time he had been in the farm implement business in Kansas City. He has been associated with W. L. Day, now president of the truck company, for many years. In his new position he will be second officer in charge of factory affairs. O. E. Stoll, manager of the New York branch, and a vice-president of the company, continues in charge of the eastern territory.

Cardway Pierce-Arrow Export Head

Col. Fred Cardway, formerly vice-president and general manager of the Packard Motors Export Corp., has been appointed head of all overseas trade of the Pierce-Arrow Motor Car Co., with offices at 342 Madison Avenue, New York City.

Ruggles Appoints Swiss

Herbert H. Swiss, recently export sales manager of the Republic Truck Sales Corp., has been appointed foreign sales manager for the Ruggles Motor Truck Co., Saginaw, Mich., and the Ruggles Motor Truck Co., Ltd., London, Ont. Swiss has a broad acquaintanceship overseas.

Mithoff Succeeds Dixn

Ravon V. Dixn, for the past two years in charge of production in the advertising department of the Cadillac Motor Car Co., has been transferred to the Detroit branch of the company, where he will have charge of sales promotion, advertising and publicity for both the wholesale and retail division. Warren T. Mithoff, formerly of Earl Motors, Inc., succeeds Dixn.

Young Is Sales Head at Janesville

O. A. Young of Denver has been appointed sales manager of the new Janesville, Wis., zone of the Chevrolet, with headquarters at the branch factory in Janesville, which has just started regular production. Young has been sales manager of the Denver zone and previously was assistant sales manager at the main offices in Flint, Mich. T. E. Houghton is plant manager of the Janesville Chevrolet works and A. J. Brand of the Fisher body unit of the Janesville works.

Reeves in South Carolina Resting

Alfred Reeves, general manager of the National Automobile Chamber of Commerce, has gone to Camden, S. C., for a few weeks rest following the big shows. He is vacationing with Col. Charles Clifton, president of the chamber, and also chairman of the board of directors of the Pierce-Arrow Motor Car Co., who spends the winters at Camden.

Whitworth Resigns

S. Whitworth, for the past five years assistant general manager of the Stutz Motor Car Co. of America, has severed his connection with the Indianapolis concern. He has not announced his plans for the future.

Amelung in Cleveland

W. A. Amelung has been placed in charge of the Cleveland office of the U. T. Hungerford Brass & Copper Co. of New York, which has been opened in the Leader Building.

Lloyd in East for Pilot

George H. Lloyd has been named eastern sales manager of the Pilot Motor Car Co. of Richmond, Ind., with jurisdiction over the eastern Atlantic seaboard and all territory east of the Allegheny Mountains from Maine to Maryland. At one time Lloyd was general sales manager of the Velie Motor Co., and for the past four years has served as eastern district manager for the Kentucky Wagon Manufacturing Co.

Mather Heads Association

Automotive men were honored with many of the offices at the annual election of the Merchants' & Manufacturers' Association of Toledo. Gordon Mather, president of the Mather Spring Co., was elected president; W. H. Kilpatrick, works manager of the Willys-Overland Co., was named first vice-president, and L. B. Wilson of the National Malleable Castings Co., treasurer. The organization represents 151 industries located in the city.

Klein Joins Eadie Trailer

Henry A. Klein has joined the Eadie Trailer Corp. of New York and will take charge of standardization of design and production of the company's patented devices for trailers and other four-wheeled reversible tracking vehicles. The Eadie Trailer Corp. was formed recently to take over the Eadie Vehicle Gear Co. John M. Eadie is president of the corporation.

Olds Promotes Dunning

H. C. Dunning, assistant general manager of the Olds Motor Works, has been named vice-president in charge of production. Dunning is a well known figure in the industry, being one of the group of executives who first saw service with the old Durant-Dort Carriage Co. at Flint. He has been associated with President A. B. C. Hardy on several undertakings before joining him at the Olds plant.

Travis Assistant to Durant

E. A. Travis, who has been general sales manager of the Locomobile Co. of America, a Durant enterprise, has been called into the executive offices of Durant Motors, Inc., in New York City, where he will be an assistant to the president, W. C. Durant, in connection with his Locomobile duties.

Miles to Visit Pharaoh's Tomb

Samuel A. Miles, general manager of the national automobile shows, has booked his passage for March 10 for his annual visit to England and France. His plans contemplate picking up Arthur E. Lumsden, European manager of the B. F. Goodrich Co., and then journeying to Egypt and visiting the tomb of Tut-ankh-amen.

Loisseau Visits GMC Truck Plant

G. Loisseau, the Paris distributor of GMC trucks in France, and W. L. Sherman, formerly General Motors Truck Co. export representative at Paris, have been visiting the Pontiac, Mich., factory. M. Loisseau said that American trucks were coming more and more into preference abroad and predicted that as soon as the tariff was revised by foreign countries sales would take a big increase.

Barnes Advertising Manager

Bert E. Barnes, formerly of Brooklyn, N. Y., has been chosen advertising manager of the Williams Bros. Aircraft Corp. of San Francisco, succeeding J. E. Hasty. Before going to the West, Barnes was vice-president of the Brooklyn Advertising Club, and a member of the Advertising Club of New York City. He was originator and editor of the "Blue Pencil," a publication devoted to house-organ and employee publications and for several years was advertising and publicity manager for the Morse Dry Dock & Repair Co., Brooklyn.

Will Demonstrate for Stoughton

Edwin J. Smith has resigned as highway commissioner of Dane County, Wis., to accept the position as manager of the truck fleet operated by the Stoughton (Wis.) Wagon Co. for highway demonstration purposes.

PERSONAL NOTES

Midgley Awarded Chemical Medal

Thomas Midgley, Jr., of the General Motors Research Corp., has been awarded the 1922 Nichols gold medal presented by the American Chemical Society to the author of the most exceptionally meritorious paper published during the year in the society's journals. Midgley, who is at the head of the fuel section of the Research corporation's laboratories at Dayton, Ohio, gained this honor through his contributions in developing an anti-knock compound to be used in the fuel of internal combustion engines. The medal will be presented at a dinner to be held in New York March 9, when Midgley will review the effects of anti-knock compounds on gaseous detonation and illustrate his remarks with slides. His talk will be accompanied by experiments.

Koether Addresses Engineers

B. G. Koether, recently appointed director of the advertising, sales and service staff of General Motors Corp. at Detroit, and a member of the advisory council of the Federated Engineers Development Corp. of Jersey City, N. J., was one of the speakers at the council's February meeting. The meeting was in the nature of a farewell for Koether, who is moving from Newark to Detroit to take up his new duties there. Among the speakers were Dr. Charles P. Steinmetz, vice-president of the organization; Sir Charles Higham of London, Dr. Bradley Stoughton, M. Wilson-Laurenson of the Union Carbide Co., E. St. Elmo Lewis and T. Irving Potter.

McNaughton Touring West

Lynn McNaughton, vice-president and general sales manager of Cadillac Motor Car Co., is on a six weeks' tour through the western territory, his immediate objective being the San Francisco show, which he will attend during the week Feb. 17 to 24. He will visit distributors en route, and following the show will cover the coast territory north to Vancouver and south through Texas, Arizona and Louisiana.

Hickey and Davidson Sail

Harrie T. Hickey of the sales-advertising-service section, advisory staff of General Motors Corp., Detroit, and W. J. Davidson, technical engineer of General Motors of Canada, sailed this week on the Berengaria for England, where they will join James D. Mooney, vice-president of General Motors, New York, for a six weeks' stay, to study service conditions in Great Britain.

Thompson in California

W. N. Thompson, president of the Stutz Motor Car Co. of America, Inc., has gone to California to watch the Stutz developments on the Pacific Coast following the introduction of the six.

WORLD'S AIR RECORD BROKEN BY LECOINTE

NEW YORK, Feb. 19—Cable advices from Paris state that Sadi Lecointe in a Nieuport-Delage plane, equipped with a 300 hp. Hispano-Suiza engine, has broken the world's speed record by flying four kilometers at the rate of 377.657 kilometers an hour, or 234.064 m.p.h.

This feat was accomplished last Wednesday at Istres, near Marseilles. The previous best record was 358.836 kilometers an hour, made at Detroit last October by General William Mitchell. Lecointe's time by kilometers was: First, 9 1/5 sec.; second, 10 sec.; third, 9 2/5 sec.; fourth, 9 4/5 sec.

S. T. Thompson Elected Secretary

S. T. Thompson, general manager of the Duplex Engine Governor Co. of Brooklyn, has been elected secretary of the company.

Ancillary Receiver Named for Carlisle Tire Company

NEW YORK, Feb. 20—Robert L. Baird has been appointed ancillary receiver of the Carlisle Tire Corp. and the Carlisle Retail Tire Stores, Inc., by Judge Hand of New York and Judge Campbell of Delaware. Equity receivership and bankruptcy proceedings are pending against both of these corporations in Delaware and Connecticut.

The Carlisle Tire Corp. was incorporated in November, 1919, and purchased the assets and assumed certain liabilities of the Carlisle Cord Tire Co. of Andover, Mass. The plant of the new company is located at Stamford, Conn., and when the deal was made Joseph M. Gilbert was president and J. S. Bretz, vice-president, both of whom are well known in the industry.

The corporation's capital stock is 300,000 shares of common of no par value and $3,000,000 8 per cent cumulative preferred of a par value of $25. Outstanding were 277,958 shares of common and $2,215,575 preferred. There was no funded debt. The corporation's real estate and equipment was valued at $697,142 as of Dec. 31, 1921.

RECEIVER FOR FALOR RUBBER

AKRON, Feb. 21—Walter T. Akers has been named receiver for the Falor Rubber Co., manufacturer of inner tubes. Upon application of Shelby Falor, president of the company and former Goodyear official, the original receivership, under which Charles F. Schnee was named receiver, has been abated and Akers has been placed in charge of the company. According to Falor the company is solvent, and the receivership was created as a matter of protection for the time being.

Prof. Terry, N. A. C. C. Law Counsel, Dies

Associated with Legal End of Industry Since Early Days of N. A. A. M.

NEW YORK, Feb. 20—Charles Thaddeus Terry, general law counsel of the National Automobile Chamber of Commerce, died last night of angina pectoris. His death comes as a blow to the automobile industry in which he long had been a leading legal light.

Terry's connection with automobile legislation and litigation, covering two decades, began in the days when the National Association of Automobile Manufacturers was in its infancy. Percy Owen, now president of the Liberty Motor Car Co. of Detroit and then secretary of the N. A. A. M., was responsible for Terry's affiliation with the automobile manufacturers, which lasted from 1903 to the present.

When the present National Automobile Chamber of Commerce succeeded the Automobile Board of Trade, which was the result of the merging of the warring interests of other days, Terry remained at the legal helm.

A fitting tribute to his legal ability was paid today by an N. A. C. C. executive, who said that Terry always had advised his automobile clients so well that they never got in the courts.

Identified with A. A. A.

As a car owner Terry took up the cudgel for the motorist and for years was chairman of the legislative committee of the American Automobile Association. In the early days he fought hard to prove his contention that the States had no right to compel owners to pay registration fees, and in one case, and that was a notable one, he got as far as the United States Supreme Court before losing the fight that was waged in New Jersey.

He prepared the Federal automobile law that was introduced in the Fifty-ninth Congress, and one of his famous victories was the New York State Restriction Act which was declared unconstitutional.

Terry was professor of law at Columbia University, and in 1919, as a member of the executive committee of the American Bar Association, came into national prominence through his opinion that the Kaiser could be extradited to this country under the treaty with Holland.

BILTWELL TIRE PLANT SOLD

AKRON, Feb. 21—A syndicate headed by A. L. Wheeler, Charles Snyder and L. J. Schott of Akron and J. J. Kent of Youngstown has purchased for $200,000 the plant of the Biltwell Tire Co. at Barberton and will reopen the factory within a few weeks. Biltwell has been in receivership for two years.

Viles Issues Report on Rubber Meeting

Hotchkiss Committee Told British Visitors It Would Abolish Stevenson Act

NEW YORK, Feb. 20—Following the return to England of the British commission which has been investigating conditions in this country in conjunction with a committee representing the Rubber Association of America, General Manager A. L. Viles has issued a report to members of the association, detailing the results of the joint conferences with the visitors over the effects of the Stevenson restriction act, which limits the export of crude rubber.

That the Hotchkiss committee which represented the association regards the act as a menace to American industry is shown by the section of the report that states that "your committee recommended that the Stevenson plan be abolished in its entirety, this recommendation being predicated on the firm belief that the natural conditions of supply and demand now existing will fully protect the plantation industry."

Foresees Effect on Industry

That portion of the just issued report referring to the results of the joint conferences reads as follows:

In presenting to the Rubber Growers Association committee facts regarding crude rubber consumption in 1922 and previous years, your special committee emphasized firm belief in the increased consumption of crude rubber for 1923 over 1922 and in the steady growth of American manufacturing industry, and that if this progress is not met by an increased production we confidently expect that our industry will be seriously injured.

Therefore, your committee emphasized to the R. G. A. committee that the restrictive plan as now operating lacks the flexibility necessary to meet our present and future requirements for crude rubber and also makes possible speculative price movements with serious consequences.

Your committee also expressed the fear that under the operation of the Stevenson plan, plantation production might decrease, whereas the utmost expansion is needed at the present time. It is the concensus of opinion that in a few years crude rubber needed by manufacturers will exceed the supply unless great strides are made in bringing additional area into production.

The committee requested immediate consideration by the Colonial Government's advisory committee, of which Sir James Stevenson is the head, of the announcement by the British Colonial Office or the local Colonial governments, that it use its discretionary powers with respect to the application of this scheme and release rubber without regard to quarterly periods or prices if necessary to prevent vild fluctuation as part of a speculative movement.

Your committee recommended that the Stevenson plan be abolished in its entirety, this recommendation being predicated on the firm belief that the natural conditions of supply and demand now existing will fully protect the plantation industry.

Your special committee emphasized to Secretary Hoover of the Department of Commerce their approval of his plans for a survey of other sources of rubber supply and our willingness to aid in the work if a Congressional appropriation were secured.

Your special committee will continue contact with the Rubber Growers Association and the Department of Commerce and with any other movement that can, in its opinion, help the situation. It should be clearly understood that the special committee will welcome at any time any suggestions or comments respecting the association's activities in this matter. Your committee feels that no activities should be undertaken by its members except through this association and until the report of the Rubber Growers' Association is forthcoming.

Question in Congress

WASHINGTON, Feb. 20—Three departments of the Federal Government are interested in the development of new sources of crude rubber in order to secure a supply to American industries. It is generally believed that the Department of Agriculture will have approximately $100,000 for experimental work in the Philippines and elsewhere, and $400,000 will be used by the Department of Commerce for a survey dealing with the question of comparative facilities, etc. Large American rubber manufacturers have strongly urged that this investigation be made at once.

Secretary of Commerce Hoover told the Appropriations Committee of the House last week that the increasing demand for rubber in this country will necessitate an increased production of approximately 50 per cent in the next ten years to meet the estimated consumption demands.

Star Rubber Net Sales in 1922 Were $1,514,362

AKRON, Feb. 22—The Star Rubber Co. reports net sales of $1,514,362 for the year 1922 and net earnings of $139,196. The volume of business in sales was 35 per cent greater than in 1921, while in units it was 46 per cent greater. The company reports inner tube production was 149 per cent greater than in 1921.

Officers of the company re-elected are L. H. Firey, president; Russell Robinson and W. A. Humphreys, vice-presidents; J. W. Dessecker, secretary and assistant treasurer, and R. S. Saalfield, treasurer.

Barley Puts on Display Its New Touring Sedan

KALAMAZOO, MICH., Feb. 16—The Barley Motor Car Co. put on display during show week the first model yet shown of its new touring sedan.

It is mounted on a standard Barley chassis, with the interior trim of leather for the front seat and velour for the tonneau. There are three heavy plate glass panels on each side, the four front ones being designed to be removed and stored in a carriage pocket just back of the front seat, thus converting the car into an open model. The rear windows raise and lower. The price is $1,685.

Tire Prices May Go Higher Next Month

British Tax, Labor Situation and Prosperity of Country Chief Factors

AKRON, OHIO, Feb. 20—Although Akron manufacturers refuse to commit themselves, further increases in tire prices on March 1 or shortly after that date are considered highly probable in tire manufacturing circles here.

The principal factor which will enter into the new price elevations is, of course, the restrictions placed upon crude rubber production by the British Government and the exorbitant export tax which American consumers of rubber must pay the British Government. The total amount of this tax in a year is variously estimated at between $100,000,000 and $500,000,000 a year.

Another factor which will enter into higher prices is the fact that labor conditions in Akron are such as to have necessitated action by rubber companies tantamount to wage increase. The Goodyear, Goodrich, Firestone and Miller rubber plants all have put into effect programs of 10 per cent bonus payments to employees. These bonuses follow demands for wage increases which have been rejected by all companies.

Labor Turnover Heavy

Labor turnover is heavier in the rubber plants of Akron than it has been for several years, and manufacturers are endeavoring through the medium of the bonus to encourage steady employment and thus cut down the heavy cost entailed by a fluctuation of labor and an abnormal turnover every day.

A third factor in the probable price boosts on tires is the evidence of returned prosperity to the country. During the slump period the tire companies cut tire prices to rock bottom, but now that more prosperous conditions are returning they feel they are entitled to a slightly greater margin of profit, as many admit they went a trifle too far in their reduction of prices a year and two years ago.

Firestone and Goodyear Install Bonus Systems

AKRON, Feb. 17—As an indication of the returning prosperity to Akron tire producing companies, and of a possible labor shortage this spring, two of the major tire companies here have installed bonus systems for their employees rather than making flat increases in wages.

Both the Firestone and the Goodyear companies now are paying 10 per cent bonuses to hourly wage earners and piece workers, for steady attendance. At Goodyear's the bonus is paid only to industrians—employees with the company at least six months who are either native or naturalized citizens.

Southeastern Trade Reports Sales Gain

Pre-Show Meeting in Atlanta Brings Out Optimistic View for Current Year

ATLANTA, Feb. 21—That automotive sales in the southeastern territory were considerably better the first six weeks of 1923 than they were during that period last year or the year before, and that the outlook for the coming year portends the biggest volume the industry has yet enjoyed in this section, was the consensus of opinion among the automobile and accessory dealers and distributors at the final pre-show meeting of the Atlanta Automobile Association in mid-February.

Practically every department of the industry seems to have experienced this improvement, including accessories and tires, passenger cars and trucks and power farming equipment. Nearly 200 dealers were present at the meeting.

As to tractor sales this business in January was the largest in the past three years, and there is a promise of the best spring volume in the industry history in this section, due to the increased buying power of southern farmers. This also is largely responsible for betterment of passenger car sales in the smaller towns and communities of this section since last October and November.

Buying Power Great

High farm prices still prevail, and banks declare that the buying power of southern farmers is probably now proportionately greater than it has ever been.

That the manufacturing outlook for the year is unusually good seems indicated by reports of lumber men in Atlanta, who state that ash demand from the automobile trade has experienced practically no abatement.

Another tangible evidence of sales improvement and general business improvement is indicated by the fact that more new automobile dealer companies have been formed in the Southeast the past six weeks than over a similar period in a good many years, and that many new buildings are being constructed or are planned for this spring by existing companies.

Dallas Dealers Report No Letting Up in Sales

DALLAS, TEX., Feb. 19—The actual retail sales of automobiles by Dallas dealers during the first months of the year were considerably greater than was expected. If there is any slowing up in business lines, the retail automobile dealers have not seen it here. The sales for January were about 10 per cent greater than for the same month of the previous year.

The indications were, dealers said, that the automobile business would continue brisk through February. March they expect a big trade as a result of the automobile show. April business, the retailers say, should be about normal, while things will probably slow up in May and June. July business should be good in east, south and southwest Texas, the retailers claim, because of marketing the heavy vegetable, fruit, tomato, potato and berry crops, and August should show increased business in north, central and west Texas because of plenty of money from grain crops. After that the new cotton will be moving, and money will be plentiful in all sections of the State. Taking everything into consideration, the retailers expect the present year to set a new record.

Massachusetts District Shows Increase in Sales

SPRINGFIELD, MASS., Feb. 21—Car sales have been on the increase in this district since the first of the month, and there is a decided gain in truck sales, as transportation companies are obliged to buy more equipment to handle the heavy traffic put upon them by the present poor road conditions.

Sales and maintenance concerns look forward to a heavy business in the spring. Dealers have felt that the demand for cars was bound to be heavy anyway, and road conditions being so bad this winter, many car owners have decided to discard their old cars and buy new ones as soon as the state of travel becomes normal.

Henninger Will Manage New Process Gear Plant

SYRACUSE, Feb. 21.—Reorganization of the personnel of the New Process Gear Co., Inc., of this city, has been announced.

A. A. Henninger, formerly of Muncie, Ind., and for several years identified with the General Motors Corp., becomes general manager, succeeding Clayton R. Burt. E. Witker, formerly with the Durant organization in Ohio, serves as secretary and treasurer.

Henninger will direct the program of expansion which the Durant interests arranged when they took over the local plant. The schedule calls for a production of 60,000 complete sets of differential gears this month, and an increased number in March. The plant is now employing 800 men on full shifts and will enlarge its organization immediately to take care of 400 more.

The Adams Axle Co., which has also been merged with the Durant interests, is to begin production of axles here next month. This plant will give employment to at least 500 men.

CADILLAC SALES AT NEW MARK

DETROIT, Feb. 19—Sales of Cadillac cars in January set a new mark for that month and indications are that February will show a greater percentage of gain over the same month of other years. Distributors are ordering heavily in anticipation of a heavy spring demand.

Steady Gain Shown in Parts Business

Question of Getting New Orders Not Most Important Problem Confronting Makers

MILWAUKEE, Feb. 19—The first half of February has more than met expectations of manufacturers of passenger cars and of automotive units and parts with respect to volume. The shows have developed a gratifying volume of orders, with the more local shows running well up to the national expositions in business.

The parts industry in Milwaukee is more concerned at present in the problem of providing adequate capacity than getting new orders or shipping directions on previous contracts. Judging by the increase in business, day after day, the existing volume is only a forerunner of what may be expected when the spring season opens and cars get into owners' hands in the greatest volume.

Makers of automotive equipment going through jobbers' hands are working virtually at capacity to make deliveries according to schedule, and are not able to accumulate the usual surplus to meet the heavier demands that ordinarily come when the touring season in the Northern zones gets into full swing.

Retail Situation

The worst and most extensive cold wave of the present winter, which set in Feb. 14 and continued several days, had a deterrent effect upon retail sales in the Milwaukee district of passenger cars. This was especially noticeable because throughout the winter business was unusually active under the stimulus of a moderate season.

Dealers are booking good orders for spring delivery, despite current climatical conditions. The weather has probably a more serious effect on the movement of used cars than on new cars, increasing the used car problem for the time being. The outlook is considered as more promising as the winter wears on and spring is in sight.

German Sales Increase as Mark Drops in Value

PARIS, Feb. 10 (*by mail*)—An important increase in German automobile sales is reported as a consequence of the drop in the value of the mark resulting from the French occupation of the Ruhr.

Prices in marks have increased enormously, 28,000,000 to 30,000,000 marks being an average figure for a medium size car, but in foreign currencies the price is so low that export demand cannot be met.

Sales on the home market have also increased considerably, many of these purchases being made for speculation.

State Control Urged for Transport Lines

Railway Executives at Washington Conference Favor Bus and Truck Regulation

(*Continued from page* 490)

now advocating regulation of motor bus competition had formerly protested against the regulation of their properties and fares.

Secretary Fall said in part:

I take it that nowadays there is almost no dissent from the idea that effective regulation of public utilities is an established and necessary part of public policy. Yet none of us is so young as not to remember when there was vigorous opposition to that policy. Regulation is coming to be recognized as a means to preserving necessary and vested rights, quite as much as to limiting the power of established interests.

The same gentlemen who used to protest against the regulation of commission of their properties and fares are nowadays demanding regulation of motor bus competition and jitney services. Likewise, among the steam railroad and the interurban trolley managers, there suddenly is developed a powerful sentiment in favor of regulating the motor-truck competition which has become such a vast factor.

All these things need and require regulation in the general interest. We may wish sometimes for a return to the "good old times" of free competition, of laissez faire, of unrestricted and unregulated freedom in business; but we know perfectly well that we shall never live in those times again. Things are too complex and too rapidly changing to make it safe to do away with our safeguards.

McCarter Urges Control

Thomas M. McCarter, president of the Public Service Railway Corp. of New Jersey, strongly advocated control by the State or communities of all forms of motor vehicles operated for profit.

He predicted that electric railways always would be in existence and no measurable expansion of motor transportation would make them disappear. It was his contention that electric carriers would be the chief means of mass transportation. He believes that the place for the bus is as a feeder to the larger carriers.

McCarter admitted that the electric carriers had a real competitor in the passenger automobile. He said it was to be expected as a development of the age. McCarter is opposed to the unrestricted competition of the bus.

It was suggested to the convention by McCarter that steps be taken to prevent bus carriers from parallelling established electric lines.

Objects to States Aiding Roads

John A. Prescott, president of the Investment Bankers Association of America, said that State aid in highway construction was an unjust burden to the electric railways, especially interurban roads, as this policy turns capital toward highway construction, which usually parallels interurban lines. He said that the unregulated condition of motor transport today was an indication of bad economics.

A good deal of the agitation to tax motor vehicles on an equality with electric carriers is inspired by the desire to bring more investors into the electric railway field, he held.

State Senator Frederick W. Davenport, chairman of the New York State Joint Legislative Committee on Taxation and Retrenchment, informed the convention that a four years' study of the utility tax situation in New York and elsewhere convinced him that New York State railways are paying 44 per cent of their net profits in State and local taxes. He declared that utility taxes should be assessed on the earning power of the property and not on its value.

During the discussion in the open session, the receiver for the Danbury Connecticut Traction Line stated that he could not see how electric roads could prosper in the face of unrestricted bus competition.

Syra-Cord Tire Prepares for Resuming Production

SYRACUSE, Feb. 21—Formal approval of the reorganization of the Syracuse Rubber Co. as the Syra-Cord Tire & Rubber Corp. has been given by Federal Judge John R. Hazel.

The approval was in the form of confirmation of the sale of the plant of the company to the new corporation for $25,000. Stone & Seymour & Co., Inc., the reorganization managers, made the formal bid for the plant and all other assets. The new concern assumes a bonded debt and claims of creditors of approximately $350,000.

Creditors and stockholders of the old firm who have not given approval of the plan though there have been no objections filed, have been granted additional time to participate in the reorganization. A total of 1402 stockholders of the company have purchased $200,000 worth of 6 per cent preferred stock and have paid in $93,000.

With the refinancing assured, plans have been prepared for the resumption of production.

Packards to Be Driven by De Palma and Boyer

INDIANAPOLIS, Feb. 19—Following the filing of the entries of three Packards for the International 500-mile race, Col. Jesse G. Vincent announces that two of his drivers will be Ralph De Palma and Joe Boyer.

The former has had charge of the construction of the racing cars. Boyer is no stranger in the racing world, having been one of the Duesenberg team that raced in the French Grand Prix two years ago, when Murphy won.

The Packard entry followed the announcement of the first nomination made, that of Harry Miller of Los Angeles, who built the car Murphy drove to victory at Indianapolis last year. Miller has not named his pilot yet.

Scottish Show Adds to British Optimism

Demand Improved Over Year Ago—Truck Prospects Somewhat Brighter

LONDON, Feb. 10 (*by mail*)—The annual Scottish show which has just concluded after running for ten days has sent the majority of makers back to their plants in a far different frame of mind than they returned last year. Reports indicate that firm orders were taken for double and even treble the number of passenger cars for most of the well-known makes.

That the improved demand was not by any means confined to low-priced or small cars is evident from the fact that one maker, handling a range of three models of 8, 12 and 16 hp., reports the latter, selling at approximately $3,750, as making the best appeal in Scotland.

The show, held in Glasgow, included trucks and motorcycles, as well as passenger cars, but although in respect to trucks prospects are somewhat brighter than they were twelve months ago, improvement is very slow, and as was to be expected, the Scottish show did not bring any influx of orders.

There were, roughly, 240 exhibitors, over 100 makes of passenger cars being represented in addition to thirty makes of trucks and fifty of motorcycles. No new models of well-known British passenger cars were shown, but four new truck models appeared, three of these being designed for loads up to 3000 lb., and two of these three—Vulcan and Beardmore—represent practically the first British truck chassis for loads over 1400 lb. intended for use solely with pneumatic tires.

There are evidences elsewhere that British truck makers are at last waking up to the existence of a good demand for speed trucks running on pneumatics; hitherto all these small models have been planned for solid tires, with pneumatics optional. But one now hears of several other makers besides those named who have lighter chassis for 3000 lb. loads on the stocks, intended for use with pneumatics alone.

New Measure Would Allow Indianapolis Race May 30

INDIANAPOLIS, Feb. 20—The anti-Memorial day race bill situation entered another phase yesterday when a new bill was introduced in the Indiana Legislature, making it possible for Indianapolis to declare a special holiday for the international sweepstakes if the Memorial day race bill making it illegal to run May 30 passes, as now seems possible.

The Memorial day bill will not be acted upon finally until the end of this week or early next week, according to the plans of House leaders.

Howe Rubber Obtains $700,000 New Money

Control Passes to Cleveland Men Who Have Figured in Refinancing Plans

CLEVELAND, Feb. 20—Operating control of the Howe Rubber Co., which has two plants in operation in New Brunswick, N. J., has come to Cleveland men who have underwritten stock of the corporation in a refinancing plan. Under the reorganization $700,000 of new money is put into the company.

Otis R. Cook and his associates in this city underwrote a large block of common stock of the company. Since May, 1922, Cook has been vice-president and sales manager of the company. He is now vice-president and general manager.

The corporation is capitalized with 70,000 shares of $100 par value preferred stock; 90,000 shares of no par common and $500,000 coupon notes. These notes were purchased and sold by Stanley & Bissel, investment bankers of this city. With the present set up of the company these notes are second in preference only to the current obligations.

John Tenny, Jr., remains as president of the corporation; Hugh M. Kerr has been made assistant general manager and also secretary and treasurer. Cleveland directors include Cook, Parmely W. Herrick, Joseph G. Fogg and Howard M. Bissell.

Cook says that sales will be 40 per cent greater this year than last. He said Howe earned its fixed charges and a substantial sum for its common stock last year, but no dividends were paid. If business continues at the present rate, dividends will start in 1923.

C. G. Spring Co. Offices Transferred to Detroit

KALAMAZOO, MICH., Feb. 19—The general offices of the C. G. Spring Co. will be moved to Detroit this week and be located on Grand Boulevard, about two blocks east of Woodward Avenue. The change will take from this city Christian Girl, Fred Cornell, sales manager; Herbert L. Jandus and Wayne E. Dunston and others in the engineering department and their respective families, also the company's chief auditor.

In addition to the general offices, the C. G. Spring has opened a large plating plant, a small manufacturing plant and greatly increased the facilities of its service station in that city.

"We are making the change for business reasons," said Christian Girl, president of the company. "A greater portion of our business comes from the Detroit territory, and it is to our advantage to be located right in the center of activities. The main plant will continue in Kalamazoo."

Reports just prepared show that during 1922 the company did a business in excess of $1,200,000, at a profit of $120,000, with a working capital of only $248,000. This meant a five times turnover for the year.

FINANCIAL NOTES

American Bosch Magneto Co. will issue its annual report the middle of March, showing the company broke about even on operations. There was considerable improvement the last half of the year but not sufficient to offset the losses of the first six months. January shipments this year were $860,000, the largest since September, 1920. They compare with $502,000 a year ago and are $200,000 above the average of last year.

Goodyear Tire & Rubber Co.'s new issue of $14,505,800 8 per cent cumulative prior preference stock voting trust certificates, offered through headed by Dillon, Read & Co., has been largely overscribed and, it is announced that no allotments will be made on oversubscriptions. The issue is redeemable as a whole or in part at 110 and accrued dividends on sixty days' notice.

Hupp Motor Car Co. has declared its regular quarterly dividend of 1¾ per cent on preferred stock, payable April 1 to stock of record March 15. The 10 per cent stock dividend on common recently approved is payable March 15. Hupp reports 1922 net profits of $3,778,780 after deducting for Federal taxes, as compared with $890,278 in 1921.

Ajax Auto Parts Co. of Racine, Wis., has increased its capitalization from $100,000 to $200,000 in order to accommodate its increased business and provide for greater capacity. John W. Bate, formerly chief engineer of Mitchell Motors Co., is at the head of the company.

Hayes Wheel Co. has declared its regular quarterly dividend of 75 cents a share payable March 15 to stock of record Feb. 28. W. B. Brunsdage has been added to the board of directors.

George W. Davis Motor Car Co. of Richmond, Ind., has declared a 400 per cent stock dividend.

Auburn Statement Shows $191,891 Current Assets

AUBURN, IND., Feb. 20—No change in the personnel of the executives of the Auburn Automobile Co. was made at the annual meeting of stockholders. A. P. Kemp was returned as president and treasurer, J. I. Farley as vice-president and director of sales, E. A. Johnson as secretary, V. B. Walling as assistant secretary and J. Zimmerman as assistant treasurer.

In addition to Kemp and Farley, the directors elected include William Wrigley, Jr., H. H. Hitchcock, F. B. Hitchcock, J. H. Rose and Ralph A. Bard.

R. H. Faulkner, formerly of the Nash-Cincinnati Co., has been named sales manager, working in cooperation with Director of Sales Farley.

The company's annual statement shows current assets of $191,891 and current liabilities of $131,844, of which $15,677 is the 1922 Federal income tax. During the year 1000 shares of preferred stock were purchased in the open market and retired.

BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

Last week the rate for call loans ranged between 4 per cent and 6 per cent, as compared with 4 per cent to 4¾ per cent in the preceding week. The situation remained unchanged for fixed date maturities. Quotations for all periods from sixty days to six months continued to be quoted at 4¾ per cent to 5 per cent, as in the preceding week. The prime commercial rate remained unchanged at 4½ per cent to 4¾ per cent.

Unfilled orders on the books of the United States Steel Corp. as of Jan. 31, 1923, amounted to 6,910,776 tons, an increase of 165,073 tons over the total at the end of the preceding month. For the first time since last October, the Jan. 31 figure showed a net increase in volume of unfinished business as compared with the preceding month and was the largest aggregate for any month since February, 1921, when 6,933,867 tons were reported. As compared with Jan. 31, 1922, the first month this year showed an increase of 63 per cent, while the increase over the low total of last February was a little more than 66 per cent.

Bradstreet's Food Index Number, based on the wholesale prices per pound of thirty-one articles used for food, stood at $3.40 last week, as compared with $3.36 for the preceding week and $3.13 for the week ending Feb. 16, 1922. The week ending Feb. 17, 1923, showed a gain of 1.1 per cent over the previous week and 8.6 per cent over the corresponding week in 1922.

On Jan. 31 unfilled orders for railroad locomotives totalling 1788, of which only eighty-nine were foreign orders, were the largest since early in 1920, when the records were first begun. During the month of January unfilled orders increased 196, and as compared with January, 1922, they showed an increase of 1581.

The Federal Reserve statement as of Feb. 14 showed an increase of $2,421,000 in gold reserves, but a decrease of $403,000 in total reserves. Bills on hand increased $83,661,000 and total earning assets $84,060,000. Deposits showed an increase of $66,251,000, and Federal Reserve notes in circulation $25,786,000. The Reserve ratio declined from 77 per cent to 75.3 per cent.

SEIBERLING SALES EXPAND

AKRON, Feb. 22—The Seiberling Rubber Co., as compared to sales of $385,000 in December of last year, estimates its February business will exceed $600,000, according to F. A. Seiberling, president. January sales exceeded $500,000, while sales for the first week in February showed an increase of 22.75 per cent over the best previous week in the company's history. The two Seiberling plants at New Castle, Pa., and Barberton, Ohio, are now producing at the rate of 1700 casings and 2000 tubes daily.

Simplified Practice Meeting to Be Held

Scheduled for March 9 Under Auspices of Division of Department of Commerce

WASHINGTON, Feb. 19—Representatives of automobile manufacturers, engineers, distributors, dealers, service men, car owners and business paper editors have been invited to attend a meeting called for March 9, at 704 Commerce Building, this city, by the Division of Simplified Practice of the Department of Commerce. It is planned at this conference to appoint a central committee representing these various interests in an endeavor to secure greater cooperative efforts along lines laid out by the department.

Four major objectives have been mapped out for the committee's consideration—better coordination of all current standardization activities, wider use and adoption of existing standards, broader application of the principle of simplification and greater support of the Hoover program of "government cooperation with industry."

The Department of Commerce has worked along similar lines with the lumber, marine and container industries with excellent results, and it is believed that the same idea can be worked out successfully with the automotive industry.

Would Embrace Entire Industry

As outlined in the call for the meeting this suggested central committee would be headed by H. M. Swetland, president of the Class Journal Co., with C. A. Musselman of the Chilton Co. of Philadelphia as vice-chairman.

It is hoped the rest of the committee can be made up of representatives from the following associations:

National Automobile Chamber of Commerce, Motor and Accessory Manufacturers Association, Society of Automotive Engineers, Rubber Association of America, Automotive Electric Association, Automotive Metal Wheel Association, Automobile Body Builders Association, Tire and Rim Association, Motor Cycle and Allied Trades Association, and American Gear Manufacturers Association.

National Association of Motor Truck Industries, Trailer Manufacturers Association of America, National Bureau of Standards, American Society of Agricultural Engineers, American Automobile Association, National Automobile Dealers Association, Automotive Equipment Association, National Tire Dealers Association, Automobile Electric Service Association, Automotive Service Association, National Association of Service Managers and other organizations identified with the industry.

RACINE TIRE EMPLOYEES LOSE

MILWAUKEE, Feb. 19—Efforts of employees of the defunct Racine Auto Tire Co., Racine, Wis., who bought shares of an issue of $200,000 second preferred stock, to have themselves set apart as regular creditors have failed. Judge Geiger of the Federal Court in Milwaukee denied the contention of the referee in bankruptcy that the money which employees paid the company for second preferred was in the nature of a loan, since the corporation guaranteed to return their money whenever they might demand it. Judge Geiger ruled that holders of second preferred could not be considered creditors any more than the holders of first preferred or common stock.

INDUSTRIAL NOTES

Shunk Manufacturing Co., Bucyrus, Ohio, will manufacture the Henderson motor truck hoist in the Allen plant in that city, having closed a contract with S. Franklin Henderson, owner of the patents. The hoist is of such design that it can be used on any truck from 2-ton to 10-ton. In addition to the hoist, special dump and box bodies for trucks will be built by Shunk.

Instant Collapsible Rim Co. has been established at Suffolk, Va., with a capital of $250,000 to manufacture collapsible steel rims for motor cars. A branch of the company has been located in Norfolk. The rim is being manufactured to adapt itself to all makes of cars. An extensive sales agency is being organized.

Transport Truck Makes Changes in 1923 Models

MT. PLEASANT, MICH., Feb. 20—Some changes have been made in the transport truck line for 1923. The line will be in six capacities, nominally rated at 2000, 3000, 4000, 6000, 7000 and 10,000 lb.

The 2000 and 6000 lb. trucks are equipped with Continental engines, and the other models are now fitted with the new Buda removable head type engine. United air cleaners are now standard equipment.

Another change is the incorporation of silico manganese alloy steel springs in place of carbon steel on the 1-ton truck. The universal joints are Blood Bros.

FARRAN-OID OFFICES MOVED

AKRON, Feb. 19—The Farran-Oid Co., formerly the Farran-Kinney Co., manufacturer of Farran-Oid fan belts, has moved its general offices from Chicago to Akron, locating at 209 Water Street. The move is made to bring the sales and administrative offices in closer touch with the production and shipping departments. The personnel of the organization remains unchanged, except that Frank H. Harris has been appointed supervisor of production and sales.

LUBRETOR CO.

A statement published in the Feb. 8 issue of AUTOMOTIVE INDUSTRIES to the effect that the Lubretor Co. of Columbus had been reorganized was in error, the Lubretor Co. being a new concern and not a reorganization. H. M. Bone is secretary of the company.

METAL MARKETS

Purchasing agents of automotive plants are beginning to encounter the same perplexities as those which abounded in the steel market three years ago. Producers are turning down more orders than they are booking. Specifications and shipping periods must be attractive to make sellers at all eager for the business. As for prices, premiums have again become the rule instead of the exception. Not unlike the conditions which prevailed during the post-armistice boom, consumers are once more bidding against one another, and all that producers have to do is to let buyers set the pace.

Some of the premiums offered by the larger automotive consumers of steel products appear to be based on the principle that it is more economical to offer inducements to mills so as to keep the supply of steel flowing to the consuming plants in conformity with the tonnages called for by operating schedules than to hazard the interruption of operations by a shortage of steel, and furthermore that these premiums will be more than justified if, by their payment, this flow of steel products can be maintained without the necessity of accumulating large reserves. That the steel market was destined to soar could be foreseen last December.

They are apparently of the opinion that it is more advantageous to pay whatever price is necessary to obtain their supplies as nearly as possible from hand to mouth than to incur the slightest risk in obligating themselves for any steel tonnages beyond those that will be instantly absorbed by their operating schedules. In a market like the present one, however, with steel producers having the whiphand it is only natural that many consumers will be obliged to assume obligations for more deferred deliveries so as to obtain their immediate requirements. The risk of their accumulating a surplus of relatively high-price steel is, therefore, one to be recognized and as much as possible to be guarded against. The market has not yet reached runaway proportions, but the more thoughtful among the large steel interests are already putting on the brakes. They are not averse to the profits which prevailing bids for steel make possible, but they know very well that following a runaway market there comes retribution, and the penalty which 1921 exacted for the excesses of 1920 exceeded the profits of the latter year.

Pig Iron. — Central West automotive foundries have bought foundry and malleable in liberal tonnages and first half of the year requirements appear to be fairly well covered, so that future market developments are looked forward to more or less serenely.

Aluminum.—The domestic producer has advanced ingot quotations 1 cent per pound to 25 cents for 98 to 99 per cent. Sheet prices are said to have undergone no upward revision. The market for imported ingot metal is about 1 cent below the domestic producer's quotation.

Copper. — Copper and copper and brass products have now reached prices that denote the complete termination of the copper market's post-war period of vicissitudes. A feature of the market of special interest to automotive consumers is that prices for wrought copper and brass products have of late advanced almost simultaneously with corresponding advances in the raw copper market, whereas in former years there was usually quite an interval between a rise in the raw copper market and the inevitable advance in wrought products.

Calendar

SHOWS

May 13-20 — New York, Spring Salon, Hotel Commodore.

FOREIGN SHOWS

March 31 - April 29 — Madrid, Spain, International Automobile Exposition at the Palacio de Exposiciones, showing automobiles, motorcycles, accessories and equipment, under the auspices of the Chambre Syndicale de l'Automobile et du Cycle.

May 9 - June 12 — Gothenburg, Sweden, International Automobile Exhibition. Sponsored by the Royal Automobile Club of Sweden.

Oct. 4 - 10 — Paris, Passenger Cars, Bicycles, Motorcycles and Accessories, Grand Palais.

Oct. 24-Nov. 2—Paris, Trucks, Agricultural Tractors, etc., Grand Palais.

RACES

May 10 — Berlin - Grunewald, German Grand Prix.

May 30—Indianapolis, Eleventh Annual 500-mile International Sweepstakes.

July 2 — Tours, French Grand Prix 500-mile race.

CONVENTIONS

May 2, 3, 4 — New Orleans, Annual Convention of the National Foreign Trade Council.

May—New York, Annual Convention of the United States Chamber of Commerce.

Oct. 24-26—Cleveland, Thirtieth Annual Convention of the National Association of Farm Equipment Manufacturers, Hotel Statler.

S. A. E. MEETINGS

Metropolitan Section

March 15—Speaker, William P. Kennedy, President, Kennedy Engineering Corp.; Subject, Trolley Buses and Flexible Vehicles for Street Railway Service.

April 19—Speaker, Edw. E. La Schum, General Superintendent, Motor Vehicle Equipment, American Railway Express Co.; Subject, Engineering Features of Fleet Operation.

May 17—Speaker, F. P. Gilligan, Secretary, Henry Souther Engineering Co., Subject, Metallic Materials for Automotive Work.

Other Meetings

March 2—Meeting in the General Motors Building, Detroit, 8 P. M. — Recent Development in Paint and Varnish Chemistry—Valentine Pulsifer.

April 26-28—Cleveland Section—Automotive Transportation.

June 19-23—Summer Meeting of the S. A. E.—Spring Lake, N. J.

October—Production Meeting of the S. A. E.—Cleveland.

Fords Enter French Fuel Test Road Race

PARIS, Feb. 10 (*by mail*)—Twenty-six cars have been entered in the three classes provided for the French Grand Prix fuel consumption road race, to be run at Tours on July 1, preceding the 500-mile 122 cu. in. race. In the lighter two-seater class, with a weight limit of 771 lb. and fuel allowance at the rate of 39.3 miles to the American gallon, the entrants are six Aries, four Salmson, three Mathis, one Senechal and one Phrixus.

In the light four-seater class, minimum weight 1984 lb. and fuel allowance at the rate of 23.5 miles per gallon, the contestants are three Aries and three Peugeot cars. The big car class, with a minimum weight of 3086 lb. and fuel allowance of 15.7 miles to the gallon, has as competitors an Aries and three Peugeots. The race will be run with only one man aboard, but with ballast representing either one or three passengers, according to the class.

Two Ford specials have been entered in the four-seater light car class, but do not figure on the official list, for the rules stipulate that the race is open only to automobile manufacturers. The Montier Co., which has fitted a special head to the Ford engine and made various changes in the chassis, claims that it is entitled to this designation. Being in doubt, the Sporting Commission of the French Club proposes to refer the matter to Henry Ford.

OTT OFFICERS ELECTED

DUQUESNE, IOWA, Feb. 19—The Ott Rubber Co., recently organized with $300,000 capital stock to manufacture inner tubes for automobiles and other vehicles, has been organized as follows: President and general manager, Joseph J. Ott; vice-president, A. F. Heeb; and secretary-treasurer, Frank E. Ott.

Directors are A. F. Heeb, W. H. Klauer, George W. Myers, Joseph J. and Frank E. Ott.

Sites are being viewed now and factory buildings will be started as soon as desirable location is secured. The incorporation details have been completed and the company authorized to do business at once.

Dodge Purchasing Agent Speaks on Wood Wastage

MILWAUKEE, Feb. 19—Addressing the annual session of the Northern Hardwood and Hemlock Association in this city, A. E. Pope, purchasing agent of Dodge Brothers, Inc., Detroit, suggested the establishment of a communal or master woodworking plant by twenty or thirty of the sawmill operators in the northern Wisconsin and upper Michigan hardwood belt as at least a partial solution of the problem of the present enormous waste in the lumber manufacturing industry.

Pope detailed the tremendous consumption of hardwoods by the automotive industries and the wastage occurring in the resawing of raw material by the consumers. By cutting dimension stocks at the mills or nearby, Pope said this wastage could be almost entirely eliminated and would benefit the hardwood industry by raising the present low values of common grades.

The suggestion is being given serious consideration by the executive committee of the Northern association and has found considerable favor. It is believed that the financial problem will be a minor one. O. T. Swan of Oshkosh, Wis., executive secretary of the association, is working out details of proposed plans.

TO USE BENZOL IN AIR FLIGHT

PARIS, Feb. 10 (*by mail*)—In an attempt to wrest the world's height record from McReady, Jean Casale, French aviator, will use benzol instead of gasoline for the 500 hp. high compression engine now being prepared for him. Casale states this is the first time benzol has been used for a height record. The plane weighs 1985 lb. with pilot aboard and is expected to climb to an altitude of 7½ miles above sea level.

1922 Added Mileage to Lincoln Highway

DETROIT, Feb. 19—Reporting on its accomplishments in 1922, the Lincoln Highway Association states that 243 miles of road were built last year at a cost of $4,678,041, and that $1,368,126 was spent in maintenance. It is estimated that by the end of 1923 more than $50,000,000 will have been expended on the improvement of the "Main Street of the Nation."

Secretary A. F. Bennet says:

From our estimates it is evident that bringing the Lincoln Highway to a statisfactory status of improvement will require a total expenditure of some $70,000,000. At the rate of five or six million dollars a year, a sum less than the average expenditures of the past five years, the first completion of the route can be foreseen about the end of 1925. Of course the route will be in splendid condition for the greater part of the distance long before that. It would be open in its entirety, without the possibility of any real difficulties, for the heavy traffic of 1923 were it not for the stubborn refusal of one State to complete a short and important link. As it is, the coming season's traffic will have to take its chances as usual on the short Utah desert stretch.

Work Accomplished During Year

Briefly summarized, the work accomplished on the Lincoln Way in 1922 is given in the following table:

State—	Mileage	New Construction	Maintenance
New Jersey ...	5.61	$1,160,823	$125,395
Pennsylvania ..	7.24	439,033	567,955
Ohio	9.13	372,718	40,430
Indiana	25.03	766,000	89,790
Illinois	2.53	70,658	33,000
Iowa	49.80	702,674	120,088
Nebraska	69.60	527,000	*100,000
Wyoming	34.00	135,433	77,860
Utah	None	None	*5,000
Nevada	48.00	435,171	20,993
California	2.50	68,529	187,612
	243.44	$4,678,041	$1,368,126

*Estimated.

Of this total, there were 56.91 miles of concrete road built; 15.13 of brick, 144 of gravel and 27.40 of permanent earth grade.
